We have two Yahoo groups. One is KenwoodMics the other is Astatic Microphones. Amateur radio audio in general, including but not limited to ESSB is welcome on these groups.

I would like to recommend that those of you who are interested in the audio quality of your signals join these groups. When a audio, microphone, or ESSB topic becomes extended, I recommend that we take it to one of these other groups. This way we can keep this group more focused on repairs and maintenance of Kenwood Hybrids.

Please understand, I am not in any way trying to discourage Fantastic Amateur Radio Audio. I live for it. I just want to keep everything in it's proper slot so to speak.

These groups are low traffic groups so they usually will not overload your mail box.

10784. TS-830S - Question Re: Tuning Up On 40 Meters

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-04 13:53:11 UTC
From: Kevin Keyes
Topic: 10784 Message: 10784

I have been having difficulty tuning up on 40 meters using K4EAA's tuning instructions. When the mode is switched to CW and I dip the plate with the meter at the LP setting the meters reads 350 mA. This is with the load set to minimum. I don't have this problem on the other bands. Am I doing something wrong or is this a normal reading for this band.

Thanks for your help.

Kevin, KI4KFS

Kevin, Do you have your manual for the 830? The instructions you need are in there. First, make sure your Ip is set right. Second, make sure your on a dummy load. Sometimes I've found an antenna to be a little hairy to tune to. Third, I often times make sure that in recieve mode I can hear the most noise by moving the last knob to the right, adjusting it for maximum noise. That part is most of the way tuned for you.

Try these first and see what you get. I often thougfht something was wrong too. Try it and get back with these results.

Remember, a dummy load or something broad enough to tune to. it's already a proper match of 50 ohms.And to listen to the recieve and adjust the drive knob. Load and plate will come easier to you in the normal process.

Do it see what it does. I'll lok back later today to see the results.

A transformer will also act like a low pass filter too in it's characteristics. typical of inductors in general. Something to remember.

n9wb <n9wb@...> wrote: OK Max, probably the transformer is acting as an RF choke as well as stepping up the voltage. If it is a good quality transformer and it seems that it is, it probably is your best bet because of it's ability to suppress RF. Glad you got it worked out, hope to hear you on soon.

Subject: [TS-520_820_530_830] Re: Impedance transformers

Just an FYI, I picked up an inline impedance transformer (Hosa) at a
local music shop. It has a female XLR connector on the low side that
plugs right into the EQ output. The hi side (10K ohm) is a 1/4" plug.
I made a patch cord and plugged it into the 830's modulator feed. I
noticed an immediate difference in the freq response and the feedback
from the monitor was gone. Just to confirm I bypassed the transformer
and the audio became very dull and the feedback returned.

Cost about $20 CDN.

Kevin,

Tuning up on 40 meters is no different than any other band, the procedure is the same. However, tuning the transmitter should be carried out with the mode switch in "TUNE" not "CW". You didn't state how high the "CAR" control was set.

10790. Fwd: [TS-520_820_530_830] TS-830S - Question Re: Tuning Up On 40 Meters

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-04 16:30:37 UTC
From: Clif
Topic: 10788 Message: 10790

It's your finals. BUT

By using the Tune position the potential damage to the tubes by
initially being in a non-resonate situation is greatly reduced.

In the FWIW dept my procedure is;

1. Set Bandswitch to band of interest.
2. Preset the load counterclockwise to the stop and the plate to the
middle of the matching band marking behind the plate control.
3. Key radio & check idling current for 60ma in SSB, meter in IP.
4. Go to Tune position and meter to ALC. Key radio and turn up carrier

control for an ALC reading, peak reading with drive control. Unkey
5. Meter to IP, key radio and dip the current using the Plate control.
Unkey
6. Mode to CW, key the radio and adjust load for 200ma and dip with
the plate. Unkey. Repeat.
7. Once the dip is at 200ma move the meter to RF and alternately
adjust the load and plate for max. Final adjustment made with the
load control for a slight reduction in power.

It takes longer to read all this than it does to do it once you get
used to it. If you have an external wattmeter you can use it to tune
for max power instead of the RF position of the internal meter.

Thanks for the reply. I have the 830 manual and have followed that. I begin by setting the mode to Tune and also use a dummy load. Once I have peaked the drive and dipped the plate in Tune mode (mA reading is about 150) using the appropriate meter settings I then switch the mode to CW and close the straight key to generate a tone. Now, when I attempt to dip the plate with the meter switch on the IP setting I can't get below 350 mA even with the load at the minimum setting. Adjusting the carrier ring has no effect on the meter.

Thanks again for the help

Topic: 10788 Message: 10793

Actually Frank the reason you go down to the tune position is to reduce power for tuning. The reason is to reduce the possibility of damging the radio due to operating while it is not aligned. For example, if you set tune and check your carrier you'll try to keep your meter back to the point they tell you so you won't so easily over drive. I used to let mine be high while tuning excessively and it stresses some components in there. If you want to get more longer life out of your tubes tune up right. excessive drive can be hard on your 12BY&X driver tube. When you see that it won't tune well you may have a driver tube going bad. Soon it won't tune at all.

Ah-ha. Your meter reading at dip in Tune mode should be around 50-75 ma. MAX. By your reading being 150 ma I question the metering circuit resistors. If they are off the the CW reading will be high also. I would change R2, R3, R4, R5 (cathode resistors) and R6, R10 (meter circuit resistors). That should straighten out the readings.

Then again by the Car control having no effect you amy have an oscillation problem.

How does the IP meter read on the other bands?

Clif

Info on "undoing" 11 meter mod to TS-830S...
Posted by: "Kevin Hunter" huntek@... kevin_ka0i
Sat Nov 4, 2006 5:09 pm (PST)

I have a Kenwood TS-830S that does not TX when the band switch is in the 28 MHz position. The receive sensitivity is VERY weak on the 28 MHz position also.

There is an extra hole drilled in the rear panel and a couple of diodes soldered to the legs of one of the ICs on the display board. One end of each diode is connected to a leg on the chip and the other is not connected to anything.

I suspect this is either a 11 meter mod that was partially reversed, or one that went bad from the beginning.

In any event, I am looking for information on 11 meter mods for a TS-830S, good, bad, or otherwise, so that I might attempt to figure out what may have been done to this radio and fix it.

Thanks & 73,

Kevin Hunter - KA0I

Topic: 10799 Message: 10799

Having joined to learn loads about these great xcvrs I find it's
not just as simple as plug-n-play. It occurs to me to ask, since I
happen to have a potentially usable audio processor, if any of you
have had the chance to try a Digitek S100 multi-function DSP unit?

It's primarily designed as a guitar effects machine (I don't play
guitar, though; it was a freebie acquisition I could not refuse) but
I'd think it'd be great to use the compression, EQ and other features
for audio conditioning, when I finally can use my General Class license
and have saved up enough money to purchase a suitable unit sometime
in the (hopefully near) future.

Any thoughts on this? And THANKS for the cornucopia of information
you all post here, it's an education you can't possible get anywhere else.

73, Terry KC9KEL

Terry:
Welcome to the group. We have found that these Kenwood Hybrid rigs are good performers and much easier to service than today's squinty-eyed surface mount rigs.

You probably will want to join the KenwoodMics group. when an audio thread gets very long, we usually take it to the Mics group so we can keep the traffic load reasonable. I will send you an invitation.

10801. PA rf choke no a TS520

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-06 14:54:56 UTC
From: KEN (G3SDW)
Topic: 10801 Message: 10801

Hi everybody,
A short time ago i had to replace the rf choke in the pa of my ts530 needless to say could not find one anywere.So as a good radio ham i set to and rewound the old one.The gauge of the new wire was slightly larger so i am sure the inductance was not quite right.The rig works ok now but does not seem as it should. I have managed to obtain a very good condition rf choke from a TS520 so can anyone tell me what the value is and any reason why it would not be suitable in the TS530.

Art;

I use RF Parts for sourcing my 6146B's and 6146W's. I don't use GE branded tubes in my Hybrid Kenwood Radios. They don't ply well together. Check with RF parts to resolve your issue, I have seen them labeled that way also. I think with the Jan number first on the label it is probably meant for the mil or earlier regraded 6146's. First run of GE so-labeled 6146B's. Early tubes in this class has a history.
Don/w5dja
ps: search on the newsgroup for an article on these tubes, it is very good reading.

10803. Replacement Cores

Yahoo group: TS-520_820_530_830 (2006)

From: Gordon
Topic: 10803 Message: 10803

Has anyone found a source for the tuning cores in the small coils used in the hybrids? I always watch the surplus shops for old coils to take them from but have not come across any sort of source for just the cores and not the whole coils. I'd like to have some on hand as I am going to start repairing Rigs as a part time job here at my shop.

Hi Terry,

I am the guitarist of the group (been playing for 27 plus years, some of it semi-pro as a lead guitarist in heavy rock bands). The S100 is a multi effects processor. The only thing that might be of use to you on it, might be whatever built-in graphic EQ it has. The rest of the effects will be either modulation based (such as choruses, and flangers [a touch of flange sounds cool on guitar]), digital delays (for doubling, etc.) phasing, or distortions (for that fuzzy, overdriven, thrash/nu metal sound, or [depending upon your preference] Marshall stack sound).

Technically, with the exception of whatever EQ is in the unit, all of the other effects are forms of distortion. Because in spite of that many of them do not flattop/clip the basic signal, they still mess up the basic sound (listen to a Chorus at a high rate of sweep; not only is it warbly, it actually starts to add octaves [think of the guitar solo on "Come as You ARE" by Nirvana]). Intentional signal distortion is a no-no, accrding to the regs.

On the input side, you will need probably an adapter for the 1/4 inch jack inputs, and possibly an impedance transformer, due to the fact that Kenwood high impedance mics are 50 K Ohm impedance (even higher than the impedance input for the processor {which is probably optimized for guitar picku impedances from 5000 to 17,000 ohms]). If you don't use a transformer, you will have loading, and you're audio will sound very dark (bassy). If the S100 has XLR inputs, you can use a good decent audio mic (like a Shure SM58 [yeah!, my favorite mic]). On the output side, your XLRs outputs are low impedance (and you have to deal with that with an impedance transformer), and the 1/4 jacks (for feeding into a guitar amp), have the same basic impedance issue as as the high impedance inputs on the processor.

All of these issues can be dealt with. Just realize that this is not a plug-and-play thing that you plan on doing.

73,
Ellen - AF9J

I don't know the value but they are different. The 530 covers 160 and
the plain 520 doesn't. If it were from a 520s it probably would work.

The TS 520 has a very similar PA, so I would suggest that it should be OK. The TS-530 manual shows L1, (nearest to the PA) as 150 micro H, L2 470 micro H.

I haven't the TS-520 Manual, but the TS-820 shows an almost identical circuit. Kenwood obviously believe in, "If it aint broke, don't fix it".

John, OK on the 6146W. I have a set of 6146W in my 830 now which work fine but if I put the GE brand in my 830 it is a no go and I have to start replacing resistors. I can use any other brand of w's and they work fine. I have tried three different sets of GE 6146W's with the same problem. Could be why RF Parts says this:
6146W-GE (GE Brand) is not recommended for Kenwood transceivers, and is not interchangable with the 6146B.

I have 2 TS830S rigs and I've used 6146B and 6146W's in both of them.
The W's will work but will not put out the same amount of power.
When I switch over to B's I get about 20 more watts out of the rigs.
The B tubes are quite old and still kicking, the W's are from RF Parts I have 4 sets.
All in all in my opinion they'll do the job. I have no worries....
At the risk of beating a dead horse "DO NOT USE CHINESE TUBES" they flash over
and will cause the rig to burn out resistors. I was wondering if the mislabeled tubes are
possibly chinese? I have never seen one so don't know what markings it has?

10817. What sound card/radio interface do you use with your 830S?

Hi All,

The group is a great resource!!!!

I have a mint 830S arriving soon and I'd like to do a bit of PSK31, RTTY, etc. Does anyone have a working set-up that they would recommend? I greatly appreciate any feedback.

Thanks!

Sometimes they work for some people and sometimes they don't. I to this point have had no problem with 6146W's in my two 830's. I've heard others say they did. That's why I said try them and see. Right now one has 6146w's in it and the other has 6146b's.

The 6146w's are nice in thaty they can run at reduced drive for my linear. I often run barefoot so I usually use the 6146b's at tihs point. I've had 6146b's in before for 3 or 4 years and not had a problem. Then I switched them out to 6146b's and did a clean up.

The 830 was checked after the 6146w's were installed and found no problems in any areas of any bands. They ran at reduced power because they were a high dissipation tube, but for me to use them with one of my Amplifiers it was not a problem.

Today I use a different Amplifier and 6146b's on the second 830, but that's like I said I run akot of barefoot, mostly on 40 meters.

Check your resistors each time you go into the PA box. I always do. Knowing ther inside of your radio is important to it's life. Keep it well grounded.

Art <wb4mnk@...> wrote:
John, OK on the 6146W. I have a set of 6146W in my 830 now which work fine but if I put the GE brand in my 830 it is a no go and I have to start replacing resistors. I can use any other brand of w's and they work fine. I have tried three different sets of GE 6146W's with the same problem. Could be why RF Parts says this:
6146W-GE (GE Brand) is not recommended for Kenwood transceivers, and is not interchangable with the 6146B.

Ok Art. I've used both in my 830 and both work good. In fact I've gone back and put w's in one of my 830's a second time. I own two of them.

Well that's two of us used them in 830's. But I ouwldn't try the chineese tube if I ever came across it. Not after I saw what happened in a 572 B. In a 572B they bias different. There it does damage.

Ruben Echevarria <ka2hhb_2000@...> wrote: I have 2 TS830S rigs and I've used 6146B and 6146W's in both of them.
The W's will work but will not put out the same amount of power.
When I switch over to B's I get about 20 more watts out of the rigs.
The B tubes are quite old and still kicking, the W's are from RF Parts I have 4 sets.
All in all in my opinion they'll do the job. I have no worries....
At the risk of beating a dead horse "DO NOT USE CHINESE TUBES" they flash over
and will cause the rig to burn out resistors. I was wondering if the mislabeled tubes are possibly chinese? I have never seen one so don't know what markings it has?

I am using a program called DigiPan with my HP notebook for PSK31.
For RTTY, I am using MMTTY. Both programs work great and the help
files have nice instructions on how to wire things up to your sound
card. Also, both are freeware.

I use MixW for my PSK31, MMTTY for RTTY and MMSSTV for SSTV. The computer speaker output goes through my RigBlaster Plus into the mic plug. I tapped the speaker audio line before the AF GAIN control so I get a fixed level signal going into the soundcard regardless of the volume setting. Be careful not to overdrive the radio, I have the MIC GAIN at 4 with my sound card sliders just under halfway, and get about 40-50W out with these settings. I get great reports on the clean signal.

If you want help setting it up, e-mail me directly with your phone number and I will call you and help you through it. I have unlimited long distance in North America.

Well, I know this is not the best practice, but I have a TS830 and a TS820 that I have used extensively on digital modes with straight cables; I got a four pin microphone plug and cut the end off of a 1/8" computer audio patch cord. I ran a second patch cord from the external speaker out to the line in of the sound card. I have made dozens of contacts with both rigs, and it worked fine, no problems. This is a temporary, inexpensive way to test, however, a proper isolating interface is a better way to go, and I have a Tigertronics SL-1+ that I am getting set up.

I have run Digipan, MixW, and Multipsk software on the "homebrew interface" above. In my experience the 820 is good on digital, and the 830 is fantastic. The addition of the variable band pass tuning and the notch filter on the 830 is very nice. I am planning to do the Shottkey diode mod, and the mod to allow use of the CW narrow filter, which should really make the 830 shine on digital modes.

Hope to work you on digital modes soon!

10824. TS-820S RF Gain and S-Meter Reading

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-08 10:58:44 UTC
From: Jeramy A. Ross
Topic: 10824 Message: 10824

Hello to the group. I have a small question about my recently acquired TS-820S. When I turn the RF-Gain down, the S-Meter reading increases in proportion. Once I have the RF-Gain down about 50% of max the meter stops responding to any signal received.. it just hangs out about half way on the scale. If I turn it down all the way, the meter reads about 2/3rd's up the scale. Is this normal?

Other than this, the rig is great and functions perfectly. This really isn't a show-stopper. Just have never seen it before.

Thanks in advance,
Jeramy / W5XTL

This is perfectly normal. The S-meter runs off of the AGC voltage. The AGC voltage is shifted when you reduce the RF gain to reduce the gain. This way, the signal to noise ratio increases as the RF gain is reduced. I have several rigs and my TS-820 S if the one I use the most because it is my favorite. You will enjoy yours. Welcome to our group.

Hi Ron,

Ruben and I talked on the telephone for a while last night and I
suggested he try using straight cables first and listen for any hum on
the receive and TX audio. I had ground loop problems doing this so I
got the RigBlaster. You have to do the CW filter mod. I use it all the
time on the digital modes. I mounted a small toggle switch on the back
of the 830 to switch it in and out. It is a godsend on PSK!

Topic: 10824 Message: 10827

Yes and maybe no. The S-meter shows the amount of gain reduction the AGC is producing. The stronger the signal, the more the AGC reduces the gain and the more the deflection of the S-meter. The RF gain control is just a manual AGC. As you turn it, you're manually reducing the gain which shows on the S-meter as an increase in signal. Normal.

One of my favorite techniques is to run with a combination of manual gain control and AGC. I leave the AGC on, but reduce the RF gain so the S-meter quits responding to background noise, or maybe a bit more. Then the AGC only responds to signals and when the signal isn't there, the background noise doesn't rise to full volume. I get the high S/N ratio of having AGC off but the AGC is still there able to handle changes in signal strength.

On my 830s, the S-meter quits responding to background noise with the RF gain turned down about 1/2. Turned down all the way, the S-meter goes full scale. Makes me wonder if your 820s has an S-meter that is reading a bit low. When you turn on the 25 KHz calibrator, and peak the signal, what is your S-meter reading? I think it should be a bit shy of S9 on 40 meters.

The simple answer is ,Yes. Unfortunately, that is the way that the S Meter works on most rigs of that era. Some later models do retain accuracy as the S Meter feed is obtained in a different way. I attempted to calibrate the Meter on my TS-530, using a very accurate Signal Generator, (TF-144), but the reading varies band to band. In reality, RST should be subjective, the S Meter does produce some hilarious reports, "You're 5 and 9 Old Man, sorry could you repeat you last over I couldn't read you!). We didn't have S Meters in the 40's and 50's, and if we did they were not accurate.

That is the way the RF Gain control works, less RF Gain more S-meter.
Unfortunately something is amiss in your setup. The S-meter should be
pegged at 60 over somewhere between 10-12 o'clock on the RF Gain
control. IT could be as simple as the S-meter isn't adjusted correctly
or the RF Gain pot is not turning down all the way.

Clif

Agree totally.

Even my on pair of SG2020's [one for each ear] as you decrease the RF gain the 's' indicator goes up. Likewise the 520 & 530 here.

As for the old days - yes we did have 's' meters - usually homebrew - wheatstone bridge and a 1mA movement [just like Eddystones used] and the scales were never redrawn, they were just indicative.

Most accurate meter I've ever seen [once set up] on older kit was that on the BRT400 series, calibrated in db

Graham, very close to Ron, being ex G8UYD - so we know when he passed the RAE [probably]. Might even have been in the same building where I sat mine.

The several TenTec rigs I've owned have been the opposite. Turn down the RF gain and the S-meter goes down. It seemed a bit more intuitive but wasn't as useful since S readings were only accurate with the RF gain up full.

On the 830s, the S-meter still reads correctly with the RF gain reduced. Provided, of course, the signal is strong enough to get some AGC action (i.e. strong enough to move the S-meter.

I like the 830s technique better.

hi,

the signalink sl-1+

http://www.tigertronics.com/sl+main.htm

needs no usb or com ports on the computer or laptop,
is powered directly from your radio (some rigs can't do this)
uses sound activation to key the radio.

Re: the RAE, I actually passed the Theory in the early 1950's. It was a two hour written exam. To my absolute amazement, I completed it in less than an hour and passed. I've mislaid my pass certificate somewhere, and I never bothered to get my C & G Certificate. In 1955 Commercial Television arrived, shortly afterwards I joined the staff, and promptly lost interest in 'Ham' Radio, (Well, we had 'big boy's toys' to play with. ;-)).

In 1978 I was persuaded to apply for my licence, I found I was dyslexic as far as Morse was concerned, so I finished up as a G8.

I would still like to master Morse, I regard it as the cr?me-de-la-cr?me of communication, it's simple to produce, simple to receive. What makes it worse is that some of my friends and colleagues are Masters of the Art!

I did pass that 'funny' test and became M3URU for a period. Strange thing was that they 'discovered' that I could send perfect code at about 8 w.p.m., yet I couldn't read anything!!!!

Agree totally.

Even my on pair of SG2020's [one for each ear] as you decrease the RF gain the 's' indicator goes up. Likewise the 520 & 530 here.

As for the old days - yes we did have 's' meters - usually homebrew - wheatstone bridge and a 1mA movement [just like Eddystones used] and the scales were never redrawn, they were just indicative.

Most accurate meter I've ever seen [once set up] on older kit was that on the BRT400 series, calibrated in db

Graham, very close to Ron, being ex G8UYD - so we know when he passed the RAE [probably]. Might even have been in the same building where I sat mine.

10835. Help with an TS-820

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-08 22:07:10 UTC
From: Greg Gollan
Topic: 10835 Message: 10835

I have recently purchased a TS-820 and I have resolved the problem with the non functioning digital display. I have noticed that the HV reading on the meter is pegged over a 1000 volts all the time but drops back to about 950 when transmitting. Could this be a meter error or is the high reading a possible indication of some other area that may need attention?
Thanks
Greg

10836. Re: [TS-520_820_530_830] Ref TS520s PA Choke

Is this the choke that is electrically in line from the PA Plate/Anode connection, in other words the loading choke, (L2 in the TS-530 Schematic, L3 in the 820)? If it is then the equivalent component in the TS-530, (L2), is part no. L40-4791-02 Ferri-inductor 4.7 micro-H, decoupled by, (HT end), C8 0.01. Next in line is L1, is part no. L40-2792-02 Ferri-inductor 2.7 micro H, connected to the 800V rail.

Comparing the PA stage of the various models, I can't see much difference. I wonder why this choke failed, the most likely component would appear to be the coupling C to the Pi-coupler, any other tube/valve short usually blows one of the R 'fuses'.

If the AC voltage on the back panel is set correctly ie: 120v then I would say the metering resistors have changed in value. I doubt seriously it's making that much voltage. "Normal" is 900-925 in SSB with no audio and around 850 at full power out in CW. Also you might check your line voltage, it could be a tad high..

10838. Mod to 820s

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-09 01:57:58 UTC
From: w1ioo
Topic: 10838 Message: 10838

I have restored an 820s. The problem with the vfo was fixed, open diode D4. The system is working great. The question I have is there has been mods added. First a Fox-Tange filter YF88H2.1 (8.830 mhz) on a small ciruit board has been added. and the 8.830 mhz signal from the input to the IF board has been brought out to the back of the system. Does anyone have any idea why this was done and should I remove the filter and try to put the system back to original. Wally w1ioo

10839. Re: [inbox] Re: [TS-520_820_530_830] TS-820S RF Gain and S-Meter Reading

Topic: 10824 Message: 10839

Thanks to everyone for responding.

The long and short of it is that it's normal. That was good news to me.

A few brought up that they thought that the meter was reading low from my description. So I went and double checked things tonight. Here's the data:

Meter reading with RF-Gain set at 50% = 9.5
Meter reading with RF-Gain set at 20% and below = Meter pegged

Meter reading at 7100 kHz = 9.0

This corresponds with data points that others sent to me, and convinced me that I should double check my data when sending a email out in the wee hours of the morning.

Thanks again to all for your help, and educating me on this great rig!

Jeramy/W5XTL

On my TS-820 my S meter pegs with the RF gain at # 1 to 2 on the RF gain. That would be lower than 9:00.

That is the way the RF Gain control works, less RF Gain more S-meter. Unfortunately something is amiss in your setup. The S-meter should be pegged at 60 over somewhere between 10-12 o'clock on the RF Gain control. IT could be as simple as the S-meter isn't adjusted correctly or the RF Gain pot is not turning down all the way.

Gregg:

On the board called the HV unit, replace all of the resistors. The reason that I am suggesting such a shotgun approach is that all of the resisters except R-5, R-6, and R-7 affect the HV meter reading. However, R-5, R6, and R-7 are very well known to change value. These resistors are very inexpensive and are readily available.

The 8830 probably was brought out to accommodate the spectrum display in the Kenwood monitor scope. If done properly, it should be OK left as is.

There is probably is a means to switch filters from the 2.1 to the original 2.4. Often this is changed with the fixed crystal switch or the DH switch. Again, if this was done correctly, it is probably OK.

It is also possible that this a cascaded filter, one following the other.

My personal preference is that I do not like narrower filters for SSB. What I would do is place the 2.1 filter up for sale and use the money to purchase the INRAD model 88 2.8 filter. It has an extra pole and thus has very sharp skirts. It also has a very nice flat top of the curve. I paid $100.00 one and put it in my $45.00 TS-820S. I still feel that it was one of my best Ham Radio investments of all time. Being somewhat of an audiophile, it really increases the enjoyment I get from my TS-820. I will not argue that I am somewhat eccentric, however.

What you need to determine is what the filter does. Is it switched in or out? Is it cascaded ? Do you prefer a narrower filter. It will help some adjacent interference in a pile up, the trade off is that to me it sounds like I have wet cotton in my ears. This is a personal choice.

It also may have added by a RTTY user.

You may also want to look for a board attached to the back of the IF board that connects into the processor circuitry. It will have a round IC on it. If you have one, it is a W6TOG Magicom processor modification that replaces the compressor in the processor with a clipper. Again, if installed properly, it works quite well. Gordon has given me one and I am reverse engineering it. The only problem that I am having is identifying the limiter IC used. It is a round unit often used in FM limiter receive circuits of the era and is similar to the one used in the Yaesu FT-101 processor except that the one in the Yaesu is in line design.

10844. TS520s PA Choke

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-09 11:39:07 UTC
From: n9wb
Topic: 10844 Message: 10844

Are you sure that the plate choke is bad ? L1 is usually the one that opens up. It is the one under the chassis. There is a capacitor to ground between L1 and L2.

TS-520
The Final Plate Choke is designated as L2
Part # L33-0218-15
The Isolation Choke is designated as L1
Part #L33-0232-05
No values are given for either of these in the 520 manual.
.....

TS 820
The Final Plate Choke designated as L3
Part # is L33-0218-15
The Isolation Choke designated as L1
Part # is L33-0032-05
L-1 is listed in the TS-820 manual as .3 uH (point 3)
L-3 no value given.

.....

TS-830
The final plate choke is designated as L2
Part # is L33-0635-05
The Isolation Choke is designated :L-1
Part # is L40-6891-13
L-1 is listed in the 830 manual as 6.8 uH
No value is given for the Plate choke.
.....

Do not confuse these L #s with the ones listed for the Final Unit. The Final Unit parts are the ones mounted on the final circuit board.

It is possible that somebody replaced the 10 ohm resistors with ones of a higher wattage. Never do this. This will cause Plate and isolation choke failure if a tube flashes over or shorts.

The part #s for the 520 and 820 are the same so they will be interchangeable.

Oh dear, oh dear I've done it again! I've given duff information. The Kenwood Schematic numbering system uses the same numbers several times, I was looking at the RF Unit, should have been General. The one we require is L2 L33-0635-05 Final Choke, no value is given, but, in various similar construction articles the value of 2.5 milli H is given, and it must be air spaced, ferrite will overheat. A Google for RF Choke produces quite a few answers. One article suggested Barker & Williamson, I couldn't find a RF Choke on their site.

Sorry about that, proves the point that you need to know the Manufactures logic to understand their manuals. Having worked mainly with Rank-Cintel gear, I thought that I could cope with anything :-(.

Hi Greg. I have a TS-820. You could check meter calibration, but if it were me, I'd play it safe, and assume that it's a component failure. Kenwood hybrids typically run 900V for the HV plate voltage,. This is higher than what 6146Bs are usually run at (and is one of the reasons why you can't get away with using junky 6146Bs in them - they'll give you problems). 1000V is WAY too much voltage on the plates. Have you checked the idle/biasing current, per the manual procedure? It should be 60mA. Running it too high will cause the plate voltage to run high during transmit.

If that is OK, you might want to check the resistors on the Finals Board. The 10 Ohm and 100 Ohm resistors will fail with age, and screw up the plate voltage. Replace any of those that don't make spec. Don't use higher wattage resistors than the specification calls for (1/2 watt for the 100 Ohm resistors, and 1 watt for the 10 Ohm resistors). The reason these resistors are the values that they are, is that like a Marshall tube amp I had years ago, these finals resistors serve as last ditch fusing to protect the finals and power supply transformer from voltage & current surges.

If the 10 & 100 Ohm Finals Board resistors are fine, then you might have to do what I did, when I knocked out my TS-820, after I made the mistake of putting in Chinese 6146Ws - check out the High Voltage Board. I had some 12K Ohm reistors that were burned out, you might have these or other resistors on the board, that are going, and messing up the high voltage feed. They are carbon comp resistors, which will break down with age. I put in metal film resistors for durability. You don't have to do this, but stick to the same power rating for them.

Good luck & let us know what happens.

Ellen - AF9J

Hi Wally, I'm guessing at the mods you are looking at, but my thought is this: If it works ok for you use it. It may seem a little narrow on side band for your liking.

As for the hook ups out the rear, it's probably a display like the Pan used in the SM-220. BS-8 pan displys are a harder to find item, probably they substituted. Operation should not be affected if this is the case.

As for the filter change, it may sound a little muffled because of the narrowing of the bandwidth. I heard of someone doing this once for RTTY. If it bothers you get a stock filter or do the mod some others have been doing here recently in the group to enhance the audio quality.

It sounds to me like you should be able to use the 820. If your into CW it won't be a problem there.

10851. Re: Help with an TS-820

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-10 04:12:48 UTC
From: Greg Gollan
Topic: 10835 Message: 10851

Thanks to everyone for their replies.

I noticed that my TS 520 shows no HV unless I'm transmitting which then shows the 850 volts. My 820 HV shows the meter pegged whether I'm transmitting or not. This can't be normal? Shouldn't the meter on the 820 act the same as the 520?

I have checked line voltage and it is 118 volts and I have the idle/bias set at 60 ma. What would cause the meter to go to full deflection when set to HV while not transmitting and work normal for the all other settings?

I appreciate all your help and apologize for not indicating that the meter reading was full deflection when not transmitting.

Greg

10852. Problem - no audio on an 830S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-10 04:14:04 UTC
From: kerrygeek1
Topic: 10852 Message: 10852

I just joined the group this evening and am already asking for help! ;-) A friend, fairly new ham, just got an 380S last weekend at a hamfest and asked me to hook it up and check it out for him. I've always been a big fan of these rigs, an old friend had an 820 back when I still had an HW-101 and I used to love to go to his place and operate it.

Here's the problem. This 830S has plenty of power, tunes up fine but has no mic audio and no CW sidetone. Since there's no sidetone, you can't key the rig with CW to work semi break-in. If you flip the t/r switch, you get full output on CW but no sidetone. I know the mic is good, I tested it on my other rig and also tried a known-good mic on this 830.

Since it uses the sidetone to key the vox, I assume the 2 problems are related (no sidetone, no mic audio). Any ideas where to look? I don't really have any test
equipment anymore other than a good DVM, I got rid of my scope the last time we moved (bad mistake...) If you guys have any ideas, maybe I can whip up a little audio amp or something to try to trace out an audio signal.

This rig also has a little switch on the back, apparently a CB mod, on the 29MHz band position it's actually on 27MHz. If he keeps it we'll do away with that little mod...

Other than the lack of any tx audio, the rig works fine on rx and sounds great, just like I remembered.

Any ideas?

Tnx,
Kerry, WD5ABC
Victoria, TX

Hi Kerry,' If you check, You will find some open Resistors on the Rectifier Board. Typical symptoms are NO sidetone and No Mic Audio. Very easy fix.

I believe the resistors will be R13 and/or R 12 on the Rectifier board. They are 100k resistors.

73,
Gordon

Thanks for the information, Guys!

It seems that the only way to do digital with the TS830S is through the microphone input, huh? I hate the thought of switiching back and forth; I was hoping there was a way to use some of the connectors on the rear panel.

Oh well, I guess that's the price of using a 'classic'!

Thanks again!

From: gary Samouris
Topic: 10857 Message: 10857

I have a ts-520 that has about 2 watts output in the tune position. The drive adjustment works fine, deflecting the ALC. Idle current is fine, set a 60 mils. No plate current or power out on the meters in the tune position. If you directly to CW, you can tune just fine and the radio appears to work ok, putting out about 120 watts. Seems to do it on all bands. Any suggestions are appreciated.

Gary,

I am at work and doing this from memory so don't hold me to the details. On the HV unit there is a resistor that is switched in only in tune mode. I think it it on the 210 line. Find the switch segment where the wiper connects to the SG switch. You will find a resistor that is switched in only in the tune position and the other terminals are jumpered together. That switched in resistor is open or has changed to a very high value.

If I was home and had access to the roadmap I could give you more specifics. If I don't see a response when I get home tonight I'll pull the schematic and send you the exact information.

Yes, You are correct Ken.
It is R15 on the Rectifier Board. It is a 56K resistor.
There also is R16 which is also a 56k resistor but I'm betting on R15
being open or way high in value.

Perhaps I am missing something but isn't that is exactly how the radio is supposed to work. The tune position is a very low power setting so you sort of pre-tune before doing the final dipping with key down.

Find the HV unit board. Replace all of the resistors and the one capacitor on this board. These parts are very common and can be obtained from Radio Shack, Fry's, Mouser, or Ceitron. They are cheap. I bet a dollar that this will fix your problem and some other problems that you do not know you have.

Back when we did this (the first time around with one of these rigs in the 80s) I built a little box with 2 mic jacks on it, one for the mic and one for the other input (a tnc, in this case). We tied the grounds together and used a switch to switch between the audio and key lines of the mic and the tnc. It works great and you don't have to keep unplugging the mic.

I work mostly CW now so I don't use my mic much anyway but that was the best way to do it back when you didn't have the other connectiosn on the back.

Buy a RigBlaster! It will solve all your problems. Or Install an RCA jack in one of the spare holes on the back of the 830 and wire it in parallel with you mic input line.

Subject: [TS-520_820_530_830] ts520 tuneup problem

I have a ts-520 that has about 2 watts output in the tune position. The drive adjustment works fine, deflecting the ALC. Idle current is fine, set a 60 mils. No plate current or power out on the meters in the tune position. If you directly to CW, you can tune just fine and the radio appears to work ok, putting out about 120 watts. Seems to do it on all bands. Any suggestions are appreciated.

10867. 520 tune up

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-10 20:47:09 UTC
From: gary Samouris
Topic: 10867 Message: 10867

I have one more question.... When tuning up the ts 520 transmitter, I dip the plate as directed, then go to RF and peak the plate and load. After doing this, I look at the plate current and it is very high. I can then get it to dip to normal value by adjusting the plate control again. Shouldn't the plate be dipped when the RF out is at its peak. I can't find anything on this in the book. Anyone got the solution
thanks
gary KC5BJ

Sean,
yes, The power is supposed to be less in the Tune position but, you
should still get plate current and you should get power out way in
excess of 2 watts.

OOOPS,
Those numbers are for an 830 not a 520. My mistake.
The 56k R6 resistor on the 520 was on the HV board.
Its on the rectifier Board in the 830.

Gordon

Hi Gary,

I have a TS-820. It behaves the same way as your 520, the 520S, the 820S, 530S, 830S, and most tube rigs for that matter. You will have to repeat dipping the plate current, and peaking the load, until they both settle down, and quit changing. Each time you go through a cycle of dipping and peaking you will notice that there is less of a change in each of them, until they finally stop changing. When this happens, you have the finals tuned. This is also the point, when they will put out maximum power. This all should be emntioned in your TS-520 manual.

I actually forgot about doing this, when I got my TS-820 (hadn't used a rig with tube finals since the early 90s), and couldn't figure out why, even after putting in a new set of finals, I couldn't get more than about 70W out of it. Luckily for me, Walt, N9WB posted a comment about finals tuning for one of the group members, and I said to myself, "duh!, guess what I'm forgetting to do!." Once I realized this, and properly tuned up the finals (it takes me about 30 or 40 seconds to do [I used tube rigs in the 80s & early 90s, so I'm practiced at doing it]), I was able to get 115-120 plus watts out of my TS-820.

73,
Ellen - AF9J

It would also be helpful, in the case of tune up issues, it's mentioned what frequency you're doing the tuning up. Although the tune up procedures are the same for any frequency, the "meter actions", are somewhat different between 160 or 80 meters and say 10 meters.

10872. Re: [TS-520_820_530_830] Problem - no audio on an 830S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-10 23:57:53 UTC
From: John Harp
Topic: 10852 Message: 10872

IS your problem no audio tone at all or just doesn't have audio tone when keying? You will only have the side tone for CW when in the CW position. When this position is on AND the VOX is turned on with thedelay set it should do the semi-breakin for you. As for the side band positions, the mic will work over there only when it's in the LSB or USB modes. Vox will work or T/R switch is flipped. don't forget to set the delay too.

Welcome to the group. We all started out that way. Well most of us. So don't feel any different, as we understand. you'll get responses here. It's a large group and active and they do watch and help out. Sometimes there's a question goes round and no answer comes easy but we all try. It's a good team. Good topics go around here too. Check out the archives while your at it. Good resource and good tools go a long ways. Watch the mail as it goes and you'll be amazed at what you'll learn here in no time.

kerrygeek1 <kmiller01@...> wrote:
I just joined the group this evening and am already asking for help!
;-) A friend, fairly new ham, just got an 380S last weekend at a
hamfest and asked me to hook it up and check it out for him. I've
always been a big fan of these rigs, an old friend had an 820 back
when I still had an HW-101 and I used to love to go to his place and
operate it.

Here's the problem. This 830S has plenty of power, tunes up fine but
has no mic audio and no CW sidetone. Since there's no sidetone, you
can't key the rig with CW to work semi break-in. If you flip the t/r
switch, you get full output on CW but no sidetone. I know the mic is
good, I tested it on my other rig and also tried a known-good mic on
this 830.

Since it uses the sidetone to key the vox, I assume the 2 problems are
related (no sidetone, no mic audio). Any ideas where to look? I
don't really have any test
equipment anymore other than a good DVM, I got rid of my scope the
last time we moved (bad mistake...) If you guys have any ideas, maybe
I can whip up a little audio amp or something to try to trace out an
audio signal.

This rig also has a little switch on the back, apparently a CB mod, on
the 29MHz band position it's actually on 27MHz. If he keeps it we'll
do away with that little mod...

Other than the lack of any tx audio, the rig works fine on rx and
sounds great, just like I remembered.

Any ideas?

Tnx,
Kerry, WD5ABC

Gary, I'm not sure the question your asking here. The Tune position is where the radio is tuned up at reduced power to avoid damage. When you have the radio tuned then switch to CW for sending code or switch to LSB or USB for voice. you can readjust while you are there just a little, but tune is for adjusting the radio at low power before you go to high power.

Does this help you?

No, there are 2 different problems that I believe are probably related. I know this rig uses the sidetone to key the vox on cw, but there's no sidetone. On USB or LSB, there's no mic audio.

I don't have a scope so tonight I poked around with an old set of headphones to see if I could find some mic audio. They were a cheap set of Walkman-style headphones so I guess they're low-Z. I grounded one side of the phones and probed around with the other side. When I touched the audio lead on the compression level pot, it started getting audio out. I clipped a 470 ohm resistor from the same point to ground, it also had audio then. Still no sidetone but that got mic audio to work.

Also, while I'm clipped to that connector on the compression level pot, if I turn the processor on the audio goes away again. While I'm clipped on, I can hear myself in the monitor just fine as long as I don't unclip the headset or resistor or turn on the processor.

Does that help give anybody any ideas? I don't just want mic audio, I want to fix it right so we'll have sidetone too. I'm trying to make him into a CW op!

Thanks for all the help guys, I'm still tinkering...but I'm done for tonight, I'm going cross-eyed reading these little bitty scanned schematics!

73,
Kerry

Hi Kerry,

Did you read Gordon's response to your original question? Message #10853 concerning resistors on your rectifier board?
For a really nice TS-830S schematic with test voltages, Ken K4EAA has a schematic on his web site www.k4eaa.com ... The resolution is good enough it will print up to 36". I loaded it on a CD and had a friend of mine run a couple off his 42" HP Plotter on 36" paper and sent one to Gordon - N6WK. If you can find someone with a large format printer/plotter it makes it really nice to read without using a magnifying glass.

I'll check that out, a bigger print would help, I'm no spring chicken.
Well, I guess 45 ain't bad, but I can't focus up close like I used to.

Yes, I tried what Gordon said, I pulled a leg up on both of those resistors, they looked fine but I checked and they were both fine. I didn't see anything else on that rectifier board that looked burned/open/etc. so I was poking around trying to find some mic audio when I discovered the thing about the processor control.

Working on this other guy's rig has motivated me though, I think next I'll see if I can get my old Drake Twins back on the air! I've also got a drift problem on my FT-990 now and then, maybe I'll track that down later too. I've been off the air for about 5 or 6 yrs so I need to get my station back up to speed after I get his 830 running right.

I don't have access to a plotter, but I have graphics programs so I could edit out the part of the schematic I need and print it big enough, thanks for the info. If I need it, maybe I'll take it to Office Depot or someplace with a big printer.

You guys are a big help, I'm not giving up on this 830 yet!

Thanks,
Kerry

Hi Kerry,
Can you tell me EXACTLY which lead on the compression level pot you
are touching to get audio ? Does it get audio if you touch ANY of the
3 leads with the Processor OFF ?

-Kerry,
Check and clean all the connectors on the IF Board. I am wondering
now if perhaps you have a bad/dirty connection especially at connector
7 on the IF Board. You also might want to flip the board over and be
sure you don't have some bad solder joints on the connector pins to
the board. Those getting loose is a common problem as Ruben found out !

Kerry,
after looking at the schematic some more, I would also like you to
check the Processor SWITCH. Is it switching properly? Also, does the
Black wire(s) on the processor control show Continuity to Ground ?

That would be connectors 4, 5, and 6 on the IF board. Pull the board and resolder the connector pins.

Gordon,

The lead I was touching was the one closest to the left side of the rig (looking from the front. It has a black wire that goes up front panel just above the proc switch, I can't tell where it goes from there. It goes into a little "bundle" with a white wire which goes from the middle lead of the compression pot up to the top lead of the proc switch. The wire I touched to make it work was the black on on the lead closest to the side of the rig

Does that make sense?

Tnx,
Kerry - back to digging in the radio...

A tip I was given by an ex-Kenwood engineer was to check all the screws holding the various boards, especially those that ground the tracks. I tried it when I bought my TS-530, second-hand, and most of them were loose to some extent.

Another point, the Instruction Manual regarding the RF line-up are very much simpler than the Technical Manual, and just as effective!

Subject: [TS-520_820_530_830] Re: Problem - no audio on an 830S

I'll check that out, a bigger print would help, I'm no spring chicken. Well, I guess 45 ain't bad, but I can't focus up close like I used to.

Yes, I tried what Gordon said, I pulled a leg up on both of those resistors, they looked fine but I checked and they were both fine. I didn't see anything else on that rectifier board that looked burned/open/etc. so I was poking around trying to find some mic audio when I discovered the thing about the processor control.

Working on this other guy's rig has motivated me though, I think next I'll see if I can get my old Drake Twins back on the air! I've also got a drift problem on my FT-990 now and then, maybe I'll track that down later too. I've been off the air for about 5 or 6 yrs so I need to get my station back up to speed after I get his 830 running right.

I don't have access to a plotter, but I have graphics programs so I could edit out the part of the schematic I need and print it big enough, thanks for the info. If I need it, maybe I'll take it to Office Depot or someplace with a big printer.

You guys are a big help, I'm not giving up on this 830 yet!

Thanks,
Kerry

Gordon,

I'm looking at the rig now, the proc switch is working properly as measured with my digital meter. The black wire on the proc control (on the far left lead, the other 2 leads are white) shows 13.3k ohms to ground. That wire appears to go over the proc switch to the front panel somewhere.

Got to run an errand, I'll come back and pull the IF board next.

Thanks for all the hints, I'll try them in a bit and report back!

Kerry

Kerry,
Tell me, does the black wire show as a ground to the chasis ? It
should. It is the Ground side of the Pot. The fact that you connect a
470 ohm resistor to it to make the rig work tells me it has lost its
connection to ground which it gets from pins 2,3 and 6 of connector 7 on
the IF board.

Kerry,

When you pull the board check every connection where wires plug in.
You may find a few have broken loose from the solder. You should use
tis time to resolder every pin of evey connector back to the boack. It
may be part of the problem, if not it will certainly prevent them in
the future.

Kerry,
I just reread your post. If the Black wire is showing 13.3 K to ground,
You have found your problem. You just need to find out why it is no
longer grounded. I just checked the 830 I have open here on the bennch.
That black wire grounds through pins 3 and 6 on connector # 7. Loosen
and retighten ALL the screws that hold the IF board down to start with.

Did Kenwood make a 6 meter transverter for the
TS-820S.
It mentions a 2-meterTV in my owner's manual but
nothing for 6 meter. If so, how much power does it
put out?

Gordon, thank you kind sir ;-)

Having lived with technical manuals almost all of my life, I find them both puzzling and amusing. I some times wonder if the people who write them have ever seen the equipment. The TS-530 is a classical example, the instruction manual tells you how to do the essential things with out equipment, a quick tweak improved the receiver considerably on several bands. When I got the Tech Manual I realised that to follow the line-up instructions as per Tech Manual, I needed some expensive gear. As it happens I do have some elderly but serviceable test gear, mainly begged, or rescued from a skip. So with the Marconi TF-144 I can do very accurate RF/IF measurements. The S Meter will only be accurate on certain bands, so I set it to be accurate on 80 as that is my most used.

Test equipment can be very interesting to acquire a rallies, (Hamfests), if it isn't well known dealers tend to sell it cheap. It's great fun to get a piece of gear for a few pounds, (GBP), because the dealer hasn't any idea of what it is!

It makes up for the times that you have been robbed by a dishonest dealer.

Hi, Bill,

I don't think they did, but, you could use any commercial Transverter that uses a low level 28 MHz input. The signal is taken from the 28 MHz Driver output from an additional winding on the coil, via a 10 pf and a 68R to gnd. It's preferable to use the SG switch to save the PA.

Incidentally, the TS-530 has this additional winding, and the pads on the PCB, all it needs is a 10pf, 68R, and a short bit of coax to a BNC. Why they didn't fit it beats me???

Spectrum make suitable Transverters, in kit form, and made up.

Ok, guys, here's what I just sent to Gordon but I wanted to keep everybody in the loop. Since I've used up about 95% of the bandwidth on this group the last couple of days, why stop now? ;-)

Maybe some of this will make sense to you guys.

Kerry

Gordon,

Yep, I started digging into the AF board last nite, it seems to me the problem has to be between where the sidetone and mic come in and the vox amp. I'm looking there now, I haven't taken any readings on those resistors yet but here's what I'm getting at some test points:

tp1: 0v
tp3: 12v
tp6: 9v
tp5: 5v
tp4: 10.2v

I don't remember which lead is which on Q1 so I'll just tell you what I'm looking at. With the flat side of the transistor facing away from me, looking down from the top, I'll call the pins 1, 2, and 3 starting from the left. I guess that's backwards, but maybe you can figure it out! Here's what I've got:
1: 12v
2: 0v
3: 12v
This transistor is sticking up from the board and doesn't look like an original part or at least not a factory installation job. Several parts on this board have solder blobs on the top of them like somebody tacked a wire to them at one time. Those parts that look fishy are:
D17
R75
R80
J18
R68
R47
R67
J21
R74

I've located some of those resistors you named off, I'll start taking some measurements on those. R1 is not original, it's too big, like a 1 watt. There is a wire wrap thing next to R1 labeled STB, it has a wht/org wire (maybe wht/red, I'm colorblind!) wrapped on it. It has

107v on it. R1 has 1.5v, R3 looks like .8v. R5 is 0v. R4 looks like either 0v or .01v. R2 looks like it connects to almost the same place as R1 and has 1.5v also.

There are several wires on this board with black tape on it, looks like somebody cut these wires and put them back together. One is white/red on a terminal between C81 and Q30. There's a yellow wire on that same terminal with tape on it. Another wire on that same post, I think it's wht/yellow, has tape on it.

On connector 6, there is a blue wire clipped, it's the 2nd wire back from the front of the rig, the first one is yellow.

It looks like somebody has been all over this AF board, I'm willing to bet that's where the trouble is. Does any of that sound helpful to you?

I'll post this over to the group so everybody else can see what we're up to!

Thanks, I appreciate all your help!

Kerry

Kenwood made the TV 502 for 2 meters and the TV-506 for 6 meters. They were originally built to attach to the TS-520. They can easily enough mouint to the 820 also.

I'm adapting one of the TV-502 units to TS-830S. I'm looking for also get a TV-506 and use that with the 830 as well. I've heard of these being attached to other Kenwood models also.

james is another person in the group who has Kenwood transverters. He uses the 520 for his and he also has a 530.

The power out is about 8 watts.

Are you interested in VHF? If so you may want to look at the TV-502's on ebay right now. I got two of them without cables and manual. I paid 80 and 50. But I can get them going too. If you don't know much of these units you may want to conder the higher cost of a complete unit.

Good new/bad news. I found the problem with the audio, I think. I pulled out the IF board and the trace between connector 7 and ground was pulled up. I jumpered it and put the board back in.

The bad news is that now I don't have any RX and the VFO doesn't light up. I figured I must have pulled a wire loose somewhere but I haven't found it. It acts like the bandswitch is between positions. The bandswitch is a little flaky anyway but I don't think I did anything to it.

Any ideas about what I fouled up this time?

Kerry - working on a snakebit radio!

If the RX and the VFO were working before you pulled the board, obviously it is a connecton on the IF board at fault. Did you resolder every pin of every connector as suggested? The sold joints may look good but the pin will actually break connection with the solder and lose contact. On a few of mine they connector actually pulled out leaving nice soldered holes! Are you sure you put the wires back in the right spot?? I marked all my connectors with a Sharpie marker so there is no mistake where they go. I have had my IF board in and out about 10 times and never had this problem Kerry. Check all the connections, wiggle a few connectors and let us know what you find.

Hi all,

Is there any member of this group that a) Lives anywhere near Mansfield, Nottinghamshire, UK and b) is able to re-tube a TS-830S for me.

I can't/won't do it as I have a co-ordination disability and do not really want to poke around with HV stuff and/or damage my radio.

If I can't get any help I may end up selling on ebay.

Oh, BTW it's definitely the tubes/valves that have gone, you can lift the anode cap clean off from of of them.

Also, on a sort of side issue, is it possible/safe to power on a TS-830S that doesn't have it's 6146's inside it at the moment(possibly with the SG switch off?).

regards and 73s

Jon, M1CBH

Kerry,

Also make sure you don't have connectors 6 & 8 reversed on the IF board. They are both 5 pins connectors and right next to each other.

73' Rick KC0HH

kerrygeek1 <kmiller01@...> wrote:
Good new/bad news. I found the problem with the audio, I think. I pulled out the IF board and the trace between connector 7 and ground was pulled up. I jumpered it and put the board back in.

The bad news is that now I don't have any RX and the VFO doesn't light up. I figured I must have pulled a wire loose somewhere but I haven't found it. It acts like the bandswitch is between positions. The bandswitch is a little flaky anyway but I don't think I did anything to it.

Any ideas about what I fouled up this time?

Kerry - working on a snakebit radio!

Texas is a tad far to help with re-tubing, but you can run the radio without any tubes. Just make sure the plate leads are not touching or close to anything. Easier to just leave the tubes in, won't hurt anything. SG doesn't matter.

From: n2mu_1
Topic: 10867 Message: 10901

Gary,

If I interpreted your post correctly, your assumption is correct and you have a problem...

If your transmitter is operating properly the plate current dip should correspond with peak RF output. Your failure to have the two events coincide (plate dip current at max RF output) is a strong indication that you need to Neutralize the Transmitter to "compensate" for the in phase passive RF output of the output tubes' grid to plate capacitance. This capacitance is very small but, because of the high gain of the tubes, its effect will be more pronounced as you go higher in frequency, ie loading up on 40meters will show a better (more correct) correlation, plate dip when RF output peaks, than loading up on 10meters where the problem will be more pronounced.

I assume that the TS-520 has a neutralization variable capacitor in the RF output stage as my TS-830S does along with a suggested procedure for neutralizing the transmitter in the manual. However, in the absence of a set procedure you should refer to the ARRL Handbook for a general guideline method of neutralization.

Alternatively you can make small adjustments to the neutralization capacitor with the rig off and recheck the plate dip correlation to the RF peak output (on 10 or 15 meters) - trial and error - until the plate dip correlates well with max RF output...This usually works effectively without getting into temporary modifications of applied output tube grid voltages and test equipment... The usual high voltage cautions apply if you choose to stick tuning tools in this area to adjust while high voltages are present.

One caveat is that if you are unable to abate the problem within the adjustment range of the neutralization capacitor (assuming it has one), replacement of the output tubes may be in order (tubes show widely varying neutralization requirements and my experience is that neutralization adjustments need to be tweaked as the tubes age) and / or you may need to modify the rig (by increasing the load) looking into the control grid of the finals by lowering the impedance a bit. The driver stage may have a little extra power to spare, to drive a slightly heavier load looking into the input of the finals control grid and still achieve full output from the finals...
Hope this helps...
What Say?

I'm probably teaching 'Granny to suck eggs', but, whatever you do, don't use the latest silver based solder. These boards were made using tin/lead solder, and the two types are incompatible.

Hoard all the tin/lead solder that you can get your hands on. There are rumours that this new regime is already causing problems.

From: Robert
Topic: 10904 Message: 10904

Hi,

I've got a very nice 830S that has not been WARC enabled and I'm finding it hard to get info for my particular rig. It's evidently an early radio(ser# 1080919) and the RF Unit is the X43-1370-00. I've seen where you should cut D5 and D6 but am confused as to whether this applies to this particular RF Unit number.

Any help here???

Thanks Much,

Robert KD7AUB

Hey, I can help with this one! Finally, after mooching off this group for the last few days maybe I can give back a little bit.

I've been working on an 830S the last several days and studying the service manual until I'm cross-eyed. You only need to clip those diodes if you want to enable individual bands. To enable all the WARC bands at the same time, you clip one wire on a connector on the AF board.

Look in the "files" section of the group and download the service and operators manual if you haven't already, they're worth their weight in gold. I believe you can find a hi-res pdf of the schematic on K4EAA's site if you want it (I think that's where I got it).

On page 37 of the service manual, it tells you how to enable the WARC bands individually or all at once. To do all of them clip the wire on the AF board at Connector 6, Pin 4. On the rig I'm working on right now, I think that wire is blue.

It says to enable the individual bands, go to the RF board and clip this part:

10MHz - D4
18 MHz - D5
24.5 MHz - D6

Just clip the wire and get them all at once, it's easy to get to. If my instructions are too confusing, the guys on here are great, they can straighten you out.

I've heard that before. I bought 2 - 1 pound rolls of solder, 2
different sizes, at a hamfest a couple of months ago. I had some of
the real fine solder I've been using since 1980 so this one should
last me until I'm too old to take on projects that need fine solder!
I use the bigger stuff for some jobs and save the .015 stuff for the
projects that really need it.

I haven't even tried any of the new stuff but have heard the guys on
the QRP list talk about it. It may be ok if that's all you use on a
project and don't try to mix it, the temps may be too different to be
compatible. I also don't know if having different kinds of metal
might cause some kind of electrolysis, I just haven't played with it.

So, I guess all those times back when I was a kid and held a loop of
solder in my mouth probably wasn't too good of an idea?

Way to go. I remember my start I felt the same way as you. Yes it's nice to be able to help.

I did the wire snip thing to my first TS-830 back in the 1980's. I put the cover back on and the radio wouldn't work. I was stumped for months. Finally for tech school I brought it in to school, but just before I did the nite before I opened the radio for a look. I found I pinched a wire closing the radio back up. A little black electrical tape solved that problem.

I didn't have the group to call on then. I was boggled then but laugh todayat it. Just wanted to share that.

kerrygeek1 <kmiller01@...> wrote:

10909. Update on the sick 830S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-13 03:16:44 UTC
From: kerrygeek1
Topic: 10909 Message: 10909

I appreciate all you guys' help but I think I'm going to tell my friend to take this rig back. If he's got his heart set on an 830, we'll find a better one, he's already seen a couple of others for sale.

I did get the audio fixed, it transmits great, has the typical 830 strong audio and sounds great with the Shure 444 mic. But, while I was playing with the audio, the rx died. I didn't even have the covers off the rig, so there's no way I did it this time! ;-) The rx is very weak, I looked around a little and found the t/r relay in the back was loose. That wasn't the problem, even though it was about to fall out, but somebody has put in an oddball relay and "modified" the pins to make them fit by breaking one off and soldering a stiff piece of wire to it so it would fit in the socket.

This rig has been butchered so many times, I'm afraid it will keep on making problems for him.

Once the audio started working, I tried the vox, I've got audio but no vox so apparently the CW break-in problem wasn't the sidetone osc but a problem with the vox. I haven't chased that one down yet.

This rig apparently spent a lot of its life as a CB and has a lot of spliced wires and soldered parts with big blobs of solder. If my friend was a techie and wanted to restore it, maybe it would be better for him but he wants to get on the air. I don't think this is going to be the rig for him.

Thanks for all your help, you guys have been great. Maybe while I'm in the old-radio tinkering mood I'll work on my old Drake twins and show him how real glow-in-the-dark radios work.

Humm, if we only had an old R-820 to go with this one, it transmits ok... ;-)

73,
Kerry, WD5ABC
Victoria, TX

Weak RX could be coming from the #6 connector on the IF board. Tug on the cable a little with the
radio on and see if the RX comes to life. It happened to me.

Subject: [TS-520_820_530_830] Update on the sick 830S

I appreciate all you guys' help but I think I'm going to tell my
friend to take this rig back. If he's got his heart set on an 830,
we'll find a better one, he's already seen a couple of others for sale.

I did get the audio fixed, it transmits great, has the typical 830
strong audio and sounds great with the Shure 444 mic. But, while I
was playing with the audio, the rx died. I didn't even have the
covers off the rig, so there's no way I did it this time! ;-) The
rx is very weak, I looked around a little and found the t/r relay in
the back was loose. That wasn't the problem, even though it was about
to fall out, but somebody has put in an oddball relay and "modified"
the pins to make them fit by breaking one off and soldering a stiff
piece of wire to it so it would fit in the socket.

This rig has been butchered so many times, I'm afraid it will keep on
making problems for him.

Once the audio started working, I tried the vox, I've got audio but no
vox so apparently the CW break-in problem wasn't the sidetone osc but
a problem with the vox. I haven't chased that one down yet.

This rig apparently spent a lot of its life as a CB and has a lot of
spliced wires and soldered parts with big blobs of solder. If my
friend was a techie and wanted to restore it, maybe it would be
better for him but he wants to get on the air. I don't think this is
going to be the rig for him.

Thanks for all your help, you guys have been great. Maybe while I'm
in the old-radio tinkering mood I'll work on my old Drake twins and
show him how real glow-in-the- dark radios work.

Humm, if we only had an old R-820 to go with this one, it transmits
ok... ;-)

73,
Kerry, WD5ABC
Victoria, TX

I agree Kerry. Even if you fixed it now, what's next?? There are lots
of good 830's out there to be had.

10912. Am I Correct

Greetings Experts.

I have just started using my TS530S on RTTY and PSK [I used to use my SG2020, but that's another story. <smile>]

I load and tune the rig normally into dummy load and then the aerial [thank goodness for automatic ATU's] Peak Drive, Dip, then tweak for maximum smoke.

Then, using the Mic Gain as the 'power control' bring the indicated output up to around 30watts on 'diddles'.

I show no ALC when running - which I understand to be correct, and an indicated IP of 150mA [- ish, but never higher]

One thing I do notice is that if, for example, and I use MixW, if I am set on 1,000hz on the waterfall and indicating 30watts, if i go up to 1,500hz the power output will rise to c40watts - I assume due to the transmit audio shape factor of the 530. [I won't say what that does to the PC - Hi ! - yes I need to sort that problem out.]
I do find that if I use the Narrow [standard] CW filter on receive, that is quite superb, and actually gives me a nice 'guideline' of where to operate without blasting the pooter into orbit.

Does this sound good ?

Graham,

I am using the 830 on PSK and RTTY with excellent results. I use MixW for my PSK as well. When everything is set right, the MIC GAIN at 12 o'clock gives me about 50 watts out. I have the sliders on my sound card at about half and then I adjust my RigBlaster to the appropriate level to get the 50W output. If I want to run less I just turn down the MIC GAIN. I get reports of a nice clean signal. I always idle on 1000 Hz. If I go higher or lower my output drops like yours. This is due to the passband of the mic amp. Did you wire your CW filter to work in SSB mode? I did and I use the narrow filter all the time on PSK. It is amazing what a difference it makes in receiving.

Thanks Max.

I use a small interface box twixt PC and 530. [G3LIV's]

Audio card slider is just on one line up from minimum, mic gain is a
gnats thingy above number 2. I have to say that it is 'very' twitchy
and needs a steady hand else the power o/p goes flying up. 3 would
probably give me full output !
The CW filter has always worked in the SSB position on this rig, as
well as on CW.

I just wish I could keep the RF out of the pooter at anything over 30
watts ish.Everything is ferrited.

One thing I do find is that leaving everything 'as is' I get vastly
different output readings when switching twixt PSK and RTTY, but I can
live with that.

Yeah, if he was a tinkerer and wanted a project (and paid a project price) that would be one thing but he's wanting to get on the air. We just got back from making about a 3 hr round trip to take the rig back to the previous owner (who was very nice and wanted us to be satisfied with the deal). He admitted that he hadn't ever tried the vox and had never operated CW on this rig.

Gordon, I told him about your rig but he's decided to save his pennies and get the Yaesu FT-897 he's been drooling over for a year or so. In the meantime, I have on old Hw-101 I built in '78 I might resurrect for him. I keep offering him my NorCal 40A but he isn't too comfortable with CW yet. I think the biggest thing is he doesn't want to borrow a rig. I don't blame him for that (but I didn't offer to loan him my 990 or my Drake Twins!)

Thanks for all your help guys!

10916. The tube question again

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-14 12:39:58 UTC
From: digs4ruff
Topic: 10916 Message: 10916

I am still a bit confused on finals. The way I understand it is as follows.

TS-820S
S2001A = 6146B or 6146W (rugged) Do not use Chinese tubes.

TS-510
S2001 = 6146 or 6146A

In the TS-820 can I use the 6146 or 6146A. Will this give reduced power.

In the TS-510 can I use the 6146b or 6146W. Will this give more power output.

thanks for the clarification
Barry in wet Vancouver. 12 inches of rain last Monday and pretty well straight drizzle since with another storm front due Wednesday.

10917. The tube question again

Another question on the tubes.

Can the cheaper 6146 6146A tubes be used in the TS-820s albeit at a reduced power output? I understand it would be about 70W instead of 100W or roughly 30% less power.

When you think of all the QRPers out there it makes you wonder why you are trying to squeeze that last watt or two out of the rig. Why do we worry about getting 110W instead of 100W? One S unit at the recieve end maybe? If we need more power to be heard in the pile up shouldn't we be looking at an amplifier of minimum 600W. Should we instead be focussed on removing all the background noise we can through such changes as the diode swap out? I know this made a substantial difference to my ability to make contacts.

I know that a successful QSO is based on both parties having a good experience but sometimes I think we push the envelope rather than just showing some patience till the bands come good again.
BE READY. IT WILL HAPPEN SOON.
regards
Barry

I recently bought a non working 80mhz frequency counter at a bargain price. It is working now after replacing one dried out electrolytic. I would like to set this up as a digital dislay for the TS-510. Any suggestions on a home brew probe. I was thinking of simply a piece of coax wrapped around the transmit coax. This would provide a readout during the TUNE portion of the tune up or if changing frequencies within the band simply switch to TUNE. WOuld the counter be overloaded in the transmit mode. Should I be looking for a spot inside the radio to monitor the frequency.
thanks
Barry

One S-unit is 6dB. 6dB is 4 times the power (or one-quarter if it's - 6dB).
So to squeeze out another S-point you'd need 400W if your reference is 100W.
On the other hand, if your power output is 25W, your signal is going to be
one S-unit less than the reference 100W signal.

The difference between 100W and 110W is not noticeable, except on the
power meter... In fact, the difference between 70W and 100W is only 1.5
dB, which is 1/4 of an S-unit.

Hi Barry,

I don't see why you shouldn't be able ot use 6146B or Ws in your TS-510. If I remember right (from what little bit of info I have on the TS-510), it was first made in the late 60s or very early 70s. The 6146B came out in 1963. Once it came out the 6146A was discontinued (the 6146 was discontinued when the 6146A came out), so I doubt that Kenwood designed the 510 for the 6146A or 6146. Therefore, you should be able to use 6146Bs or Ws. Power will not really be increased using a 6146B, and yes like the other Kenwood hybrids, you can use 6146s & 6164As. It's just that power output will be less, due to the lower plate dissipation of these tubes.

BTW - you metioned in one of your posts, about 6146s & 6146As being cheaper. I don't see how that could be so, considering that these earlier 6146 tube versions were discontinued over 40 plus years ago. I would think that they would be as scarce (if not more so), than the basic 6146B, and as such would cost as much (maybe even more) as a 6146B. Do you have a bunch of them laying around that you can use?

73,
Ellen - AF9J

Hi to the group. When I tune on 80 meters the plate tune pointer ends up at, or close to the "1.8" mark instead of near the "3.5" mark after I dip the plate. All other bands are close to their respective marks. All other readings are as they should be and I can't figure out exactly why this is occuring. Thanks for reading. Cheers, scott. KG6BRG

Yes, the 6146/6146A can be substituted for the 6146B. Check the
following link for info on substituting 6146/6146As and 6146Bs.

http://www.muchstuff.com/6146.htm

A difference of 10 watts, 110 watts verses 100 watts, will not make
any difference in signal strength at the receiving end. It's not just
the output power that makes the difference. Band conditions, noise
(receiver and/or atmospheric) and the antenna also play a role in how
well the transmitter's signal is heard at the receiving end.

Ellen
Have a look at FleaBay. The 6146Bs go for 25-45 dollars per pair.
The 6146/6146A tubes regularly sell at under $10 per pair. Most do
claim to have tested the tubes. If untested pay less than a couple
of bucks and take a chance. It would seem that price depends a lot
on demand.
regards
Barry

Hi Keith,

Actually I have an FT-897D. It's not an Orion II, but I think it's a decent rig. It depends upon what you're going to use it for. I use mine for contesting, the digital modes, 6, 2, & 432 SSB & CW, and HFpack stuff (I had a blast this last Saturday, throwing it in a backpack, hiking through some marshland trails in 40 degree weather, and talking with some west coast hams, while I was hiking). The audio is different on both receive and transmit than a TS-830S (nothing can beat tubes for tranmsit audio on SSB or AM). Yes the reciever is a bit noisier than my TS-820, but then again, that's because it's synthesized. In my personal opinion, not even DDS receivers are as quiet (even using DSP as a band-aid), as a good VFO driven receiver.

All-in-all I like my FT-897D. I also like my TS-820, and my Swan 270B. They all have their place in the shack. My 897D is my SUV, my 820 is my vintage BMW, and my Swan is my vintage Chevy Nova. It depends upon what you want to use them for.

Hi Scott,

You will notice that thre is an arced line that corresponds to each band. Is the plate dip pointer inside of the arc for 3.5? It depends upon where you are frequency wise. If you are at the upper end of the band, your 520S should generally plate tune to the high end of the arc (and vise versa for the low end of the band). But this is not written in stone. BTW, the tuning arcs for 1.8 & 3.5 do overlap each other. as do other bands.

If plate tune is excessively far off (for instance you're tuned out of the tuning arc range for the 80m band, when you're on 80m, or you wanted to tune to 3995 kHz, and you're way at the bottom end of the tuning arc), then it could be a sign of components stariting to go on the finals board, or in some cases, worn out finals (although,more than likely this would manifest itself as a loss of output power).

Don't worry about it as long as it tunes properly. Component variation
(but still within spec) can cause it. On 80m you are switching in a
couple of big caps..

Hmmmmmmm, that's news to me. I didn't realize that was the case. I wonder if it's because of the demand being lower for 6146s & 6146As (demand drives price), and/or the possibility that fewer 6146Bs were made than 6146s and 6146As. Oh well, you learn something new everyday.

73,
Ellen - AF9J

Here is a link that will fully explain the differences in the 6146 tube.

http://k9sth.com/Page_2.html

Once the page comes up, click on the article link "6146 Family of Tubes".

The document is written in Word format but can be viewed using
Microsofts Wordpad.

There are differences in the tubes as the article clearly shows.

Thanks Kerry,
I hope he gets his 897 and has fun with it.
I'm sure he'll be happy once he gets anything on the air.
Have fun resurrecting the HW-101.

This reading was at 3.945. As to the lines, although I studied them
I not sure which one to look at, seems that one skinny line goes all
the way to 21 mhz and the top line has a "hash" mark almost right
after the 3.5 number. I get 130 watts out on 3.945, and 100 watts at
29.400, so I think the tubes are ok (original S2001A's). AS I stated,
the other readings, such as IP and HV, are as the manual states. I
just was curious as to why the plate pointer was pointing at 1.8
mhz., almost straight up. My conclusion was that the skinny line
at the bottom of the scale was intended for 80 meter reference and
was looking for opinions to comfirm my theory. Thanks to the group
for responding and look foward for more thoughts. 73's scott.
kg6brg. PS I will be on 7.248 11 am to 12 pm pacific time today,
participating in the CARS net. If you can hear it, jump in and give
me a call and we can move off freq and qso. Informal and very
friendly net. kg6brg

On mine [520 and 530] there are multiple lines. the 1.8 line runs from
9o'clock to 2o'clock and is closest to the knob.
the 3.5 line runs from 9o'clock to 12oclock [and has the 7 line in the
10-11 quardant above it]
what might be confusing is that at 10.30 - between the3.5 line and the
1.8 line is the 1.8 'marker'

Scott,
Taking the assumption that everything is working properly inside your rig, departure from the central designed location of the plate tune dip is probably caused by a variation in your coax feed point impedance from a 50 ohm load. You may have a reactive component at your frequency of interest, but if you are concerned about abnormal rig tuning operation try loading all bands into a known 50 ohm dummy load and see if the plate dip falls within the marked tuning ranges. I'm betting that your antenna is altering the coax driving point impedance enough to depart from the expected result.

If you don't have a dummy load you can experiment by adding a 1/4 wave section of coax to your coax feed point and see if the plate dip point moves dramatically on 80 meters. If the dip point moves, your coax feed point impedance is suspect. If not, you may infer that there is some component within the rig that has changed and might want to investigate further. - Knob calibration locked incorrectly, tube capacitance different from original new tubes, voltage changes, switched in capacitance in the tank circuit, etc.... There are a multitude of parameters that can alter the dip point, but, if you have full power your probably OK.

What Say

73 Hank N2MU ...-.- ..

He doesnt' seem to be in any hurry to borrow my HW-101 so maybe I'll leave it for now and work on my Drake Twins, my all-time favorite rig. Well, my current rig (an FT-990 I bought new in '92) is better for contesting and is easy to operate but the Drakes are real classics, from an era before the 820/830. I always thought they were at least as good as the Collins rigs and not as finicky or delicate. The copper plated chassis is pretty cool too. They also kept the shack warm in the winter but uncomfortably hot in the Texas summers!

Maybe I'll get the Drakes going and see if I can talk him into the 101 around xmas if he doesn't have his yet. We took my truck last nite to take the 830 back to its owner and I let him operate my old TS-430 in the truck so I think he's hooked.

73 guys, thanks for your help!

You may keep it for spare parts or a future project. Good luck. To bad about this one. Gonna need some real TLC.

kerrygeek1 <kmiller01@...> wrote: I appreciate all you guys' help but I think I'm going to tell my
friend to take this rig back. If he's got his heart set on an 830,
we'll find a better one, he's already seen a couple of others for sale.

I did get the audio fixed, it transmits great, has the typical 830
strong audio and sounds great with the Shure 444 mic. But, while I
was playing with the audio, the rx died. I didn't even have the
covers off the rig, so there's no way I did it this time! ;-) The
rx is very weak, I looked around a little and found the t/r relay in
the back was loose. That wasn't the problem, even though it was about
to fall out, but somebody has put in an oddball relay and "modified"
the pins to make them fit by breaking one off and soldering a stiff
piece of wire to it so it would fit in the socket.

This rig has been butchered so many times, I'm afraid it will keep on
making problems for him.

Once the audio started working, I tried the vox, I've got audio but no
vox so apparently the CW break-in problem wasn't the sidetone osc but
a problem with the vox. I haven't chased that one down yet.

This rig apparently spent a lot of its life as a CB and has a lot of
spliced wires and soldered parts with big blobs of solder. If my
friend was a techie and wanted to restore it, maybe it would be
better for him but he wants to get on the air. I don't think this is
going to be the rig for him.

Thanks for all your help, you guys have been great. Maybe while I'm
in the old-radio tinkering mood I'll work on my old Drake twins and
show him how real glow-in-the-dark radios work.

Humm, if we only had an old R-820 to go with this one, it transmits
ok... ;-)

Actually I'm looking for one myself. I've been watching ebay and eham.net. I look anywhere I see ham gear swap on the web. They show up now and again. I noticed they appear once a year on ebay about this time of year. One just went past about two months ago when I was out a job. Now I got cash and can't find it yet. The best material for building the cable is in the manuals. You may want to read that otherr email I returned info on to the other person on TV-502. Some of that may prove interesting to you too. It took me a while to get it all together.

Bill Richarz <billn4dh@...> wrote: John,

I'm interested in a working TV-506 at this time

Subject: [TS-520_820_530_830] Off Topic Test Equipment

I recently bought a non working 80mhz frequency counter at a bargain
price. It is working now after replacing one dried out electrolytic. I
would like to set this up as a digital dislay for the TS-510. Any
suggestions on a home brew probe. I was thinking of simply a piece of
coax wrapped around the transmit coax. This would provide a readout
during the TUNE portion of the tune up or if changing frequencies
within the band simply switch to TUNE. WOuld the counter be overloaded
in the transmit mode. Should I be looking for a spot inside the radio
to monitor the frequency.
thanks
Barry

Thanks Graham, Studing more with a magnifier, I think I understand the lines and what they relate to. The 3.5 line does indeed extend to the 12 o'clock position. The 1.8 line, is the inside skinny line and extends to about the 2 o'clock point. The 7 position is seperate from the other lines (I did not see it without my magnifier). The 3.5 tune was the only one that seemed out of bounds, but now I see it was in bounds. Thanks again to all and to Graham for his imput.

Sounds to me like you have a fine TS-520. Hope to hear you on some time. We have a Yahoo Group called KenwoodQSO. We post that we are going to be on and try to contact each other with our Kenwoods. Please feel free to join!

10946. FOR SALE: TS-830s with 2 CW filters + HEIL HC-4 MIC + EXTRAS

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-15 14:54:43 UTC
From: Sotiris Katsimaglis
Topic: 10946 Message: 10946

Hi everybody, I am selling a TS-830s (GOLD edition).
The rig is in perfect condition, with new tubes installed and 2 pairs of 6146W as spares.
It has both 500 Hz CW filters (for 8.83 & 455 IFs), that are modified to work on SSB also using the FIX button. This modification is very useful in AFSK modes (RTTY, PSK31 etc).
The set includes also the original Kenwood hand mic, Schuko 220VAC original power cable, a Heil HC-4 element (pulled from a working HEIL PRO headset), original owner's manual, copy of service manual, 4 spare 6146W tubes in very good condition and a spare 12BYA7 driver tube.
Due to the shipping weight (aprox. 22-25 Kgr), I would like to sell it within Europe. Estimated shipping cost is aprox. 100-125 Euros using 5 days delivery service with couriers (i.e. TNT). You can use your own courier service to collect, if you can obtain lower shipping charges, or to collect youself. Pictures are available on request.
I have a 100% positive profile in ebay using my call.
I am selling it because I have switched to the smaller TS-480SAT.
I am asking 500 euros plus SHIPPING.
All questions are welcomed at sv1bdo (at) hotmail.com

Jolly good show !

MInd you - on my 530 [I assume all] the 18/14 line 'overlaps' with a zig-zag. I've never really bothered whether the pointer is within the paint - I tune and go <smile>

Anyone who has worked me on SSB from home [ie: not /P] will have heard/worked either the 520 [1999 - 2004] and within the last two years, more likely the 530.

Since the beginning of November this year - that also applies to PSK or RTTY QSO's

10949. fan oil

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-16 00:00:51 UTC
From: W8JV
Topic: 10949 Message: 10949

Recently somebody recommended using Labelle 101 oil to lube rig fans. I went to the biggest hobby shop in this area and was told in no uncertain terms to NEVER use Labelle 101 oil on any device that may contain plastic parts. In the long term formula 101 has slnvents that will destroy plastic. I was advised to use either Labelle 107 (medium weight) or Labelle 108 (light oil) since both of these are formulated to be "PLASTIC COMPATIBLE". His warning was that no matter what type of oil you use be sure it is PLASYIC COMPATIBLE or ant plastic parts in the unit will be compromised. The cost of 108 is the same as 101.

10950. TS-820S Transmit Problem

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-16 04:18:45 UTC
From: Stephen Davis
Topic: 10950 Message: 10950

Hello All,

I picked up a Kenwood TS-820S a couple of weeks ago and was told that it would not transmit. I finally had a chance this evening to take a look at it. I fired it up, hooked it to a dummy load and let it warm up. After about 5 minutes, I went through the tune-up procedure and sure enough, no output. The meter showed I did have 60ma of bias and about 850 volts HV. I unplugged it, took the covers off and had a look. First thing I noticed was that the cathode and screen resistors looked new. Visual inspection did not turn up any obvious problems. Next I took a look at the transmit relay and it looked okay. I then plugged in the power cord, and turned the radio on. Heaters on all three tubes were glowing. I put the function switch into tune mode and flipped the xmit switch and observed that the transmitter relay was opening and closing as I went from receive to transmit and back again. I then decided to go through the tune-up procedure again. I put the mode switch to CW and the xmit/receive switch to xmit. I got distracted for a couple of seconds and turned away from the radio. As I turned back towards the radio, I heard three distinct "pops" and saw three blue flashes come from the xmit board. After coming back down from the ceiling (it really startled me!!) I unplugged the radio and took a look. R3 (10 ohm, 1 watt) had pits in it were little pieces had apparently been blown out of it! R2, R5, and R6 looked okay. I plan to replace all four of these (need to make a trip to Radio Shack tomorrow).

But, before I replace the resistors, I need help in figuring out what is causing the resistor(s) to blow. I am thinking a bad final tube, but would appreciate any thoughts the group might have on this or any troubleshooting tips.

Thanks,

Steve K7QHU

A final tube probably shorted. replace these resistors with 1 watt resistors as were the originals. These blew when the finals shorted and saved you a lot of grief.
Once you get these replaced and get new finals, your next problem is to get transmit. Once you are in a situation where you can get 60 ma of idle current, the next problem is to see why you are not getting any drive. Be sure that any switches on the rear are in the proper location. Some 520 rigs had switches for transverters.

Next step is to see if you get any ALC meter indication when peaking the drive control on CW. Be sure that the carrier control is fully up.

Let us know when you get this far and we will take you from here. Also tell us if you have a scope.

Vy 73, Walt N9WB

and saved you a lot of grief.

I use 'Singer' sewing machine oil - the same stuff works brilliantly
on model railway loco's and bearings. - i used to nick Mums's when at
home, and have since inherited a 3/4 full bottle. It'll last my
lifetime [it's probably the same bottle i used 40 years ago - Hi !]

Oh yes - works pretty good on sewing machines as well <smile>

Hi

Several years ago there was a oil from Costa Mesa Lubricant Inc called TRI-FLOW
4 U.S. FL. OZ. (118 ml) which is superb for this type of use. A friend of mine bought
it for me when he visit USA. A motorcycle dealer in Chicago (HD I think) strongly recommend
it for this use and I´m very pleased with it. I just wonder is it possibly to
buy it or is it "out of order" ?

Stephen, after you replace the resistors with the proper wattage and value, try to to use a different pair of tubes that are known to be good.

Stephen Davis <sdavis@...> wrote: Hello All,

Update...

Also coming across the TV in the bedroom on 20m. Definately never happened before. Perhaps something has let go in the antenna or rain has somehow gotten into the traps or the matching box. Antenna is a Cushcraft R7.

Max

Max,
I had a similar problem a few months ago. Turned out my Coax was
arcing between the center conductor and the Braid in a spot where the
Coax made a sharp bend. I replaced the Coax and the Problem was solved.
Antenna was a Cushcraft R-7000. Exact same Symptons you are describing !!

Mark if you describe the problem you'll probably get quite a few people to
come back to you with help and advice and maybe you'll save some bucks
in the process. You'll also wind up with a little more knowledge and few
new friends.

10967. [TS-520_820_530_830] TS-820S Transmit Problem - Update#1

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-17 06:29:37 UTC
From: Stephen Davis
Topic: 10950 Message: 10967

Walt and John,

Thanks for your reply's. I did not get a chance to pick up the resistors today. However, I wanted to make some progress, so I decided to take the tubes from the 820 that we suspected might be shorted and try them in my TS-530. I had check the tubes for shorts after reading Walt's primer in the archives and found no shorts. The finals by the way are the original S2001A's. Anyway, I put them into the TS-530, hooked up the dummy load and powered up. I let the tubes warm up for about 5 minutes. I check the bias and it was a little high, so I adjusted to 60ma. I then went through the tune-up procedure, keeping a wary eye on the rig. The rig tuned up fine and I was getting full output on 40 meters. I spent about ten minutes, using a CW key to send into the dummy load every so often. The tubes seem to be okay. Didn't want to run for too long as I did not want to neutralize them in the 530. So, it seems the problem is not with the finals, which is kind of disappointing because this means there is a more difficult problem to track down. My next step will be to check the tube sockets for any shorts. Any other suggestions would be welcome.

Thanks

Steve K7QHU

Subject: Re: [TS-520_820_530_830] TS-820S Transmit Problem

Stephen, after you replace the resistors with the proper wattage and value, try to to use a different pair of tubes that are known to be good.

Stephen Davis <sdavis@beachnet. <mailto:sdavis%40beachnet.com> com> wrote:
Hello All,

I picked up a Kenwood TS-820S a couple of weeks ago and was told that it would not transmit. I finally had a chance this evening to take a look at it. I fired it up, hooked it to a dummy load and let it warm up. After about 5 minutes, I went through the tune-up procedure and sure enough, no output. The meter showed I did have 60ma of bias and about 850 volts HV. I unplugged it, took the covers off and had a look. First thing I noticed was that the cathode and screen resistors looked new. Visual inspection did not turn up any obvious problems. Next I took a look at the transmit relay and it looked okay. I then plugged in the power cord, and turned the radio on. Heaters on all three tubes were glowing. I put the function switch into

tune mode and flipped the xmit switch and observed that the transmitter relay was opening and closing as I went from receive to transmit and back again. I then decided to go through the tune-up procedure again. I put the mode switch to CW and the xmit/receive switch to xmit. I got distracted for a couple of seconds and turned away from the radio. As I turned back towards the radio, I heard three distinct "pops" and saw three blue flashes come from the xmit board. After coming back down from the ceiling (it really startled me!!) I unplugged the radio and took a look. R3 (10 ohm, 1 watt) had pits in it were little pieces had apparently been blown out of it! R2, R5, and R6 looked okay. I plan to replace all four of these (need to make a trip to Radio Shack tomorrow).

But, before I replace the resistors, I need help in figuring out what is causing the resistor(s) to blow. I am thinking a bad final tube, but would appreciate any thoughts the group might have on this or any troubleshooting tips.

Thanks,

Steve K7QHU

On digital modes, it doesn't do it with either antenna. When on SSB it only does it on the vertical. When I switch to my dipole it is fine. So that leads to me to think it is either the coax to the vertical or the vertical itself. We have had heavy rains here for a few days now, perhaps some rain as got into the mathcing box at the base of the antenna.

Yes it is Walt. I don't have any other mic to test, but it does not do it on digital modes. I moved some equipment around this morning and noted the following, and don't laugh...

When I pull the desk out from the wall, it goes away almost 100%.

If I unplug the wall wart to my rigblaster, it gets worse.

I also have an extension cord that runs through the wall under the desk into the furnace room where my power supply used to sit. right now it is not plugged into anything but is still plugged into the AC socket. If I unplug it from the wall socket it gets worse, yest it has no connection to the setup at all. Which leads me to think it is a grounding problem. But why would it not do it on my other antenna?

HI Max,

Your shack must not be in the RF envelope with the horizontal antenna but is with the vertical. I had the same problem with a microphone. ..The RFI would also almost go away when I would touch the mic. Turned out to be a grounding problem with the microphone plug itself .. I fixed my problem when I grounded the mic plug... I clipped 1.5" piece of wire off a 1/4 watt resistor. Open the mic plug up and solder one end of this wire to pin 4 along with the mic shield wire. Run the wire out the back of the plug when you assemble it and loop it under one of the screws to the clamp portion of the mic plug. RFI went away. Mine was also on 20 meters by the way. Which antenna were you using last weekend when we spoke? I sure didn't detect any RF in your signal.

Hi Rick,

I was on the vertical that is causing me the grief now. Two days ago I had no trouble, then just last night it started. I thought it must be because of the rain. The XLR plug on the mic itself has three wires, audio hot, audio ground (braid) and black ground. I ran a ground wire from the black wire to the mic plug itself. If I grab the mic the RF goes away as well.

I am going to tear the station apart tonight and put it back together on piece at a time and run tests along the way. I don't understand why it would start all of a sudden. What good does it do by grounding the mic plugs themselves? My mic plugs into the RigBlaster and then nto the radio.

I guess the only thing is to start over.

Hi Max,

If you've never had this probelm with the rig before on 20m, I'd ahve to agree with Gordon - your coax has some problems. If this is the first time you've used the rig on 20m SSB, then it might be a characteristic of the rig. As an apartment dweller, I've dealt with RF feedback issues off and on for years. Unbalanced antennas (such as verticals, and endfeds) are notorious for giving RF feedback problems. The thing is, they won't give you RF feedback on every single freq. One thing that can help, is to put a current choke (basically several windings coax, with, or without ferrites snapped onto the windings)in the feedline, next to the TS-830S.

Hi Ellen,

I was talking to Rick, KC0HH, on the weekend on 20m on the same rig with the same antenna and it was working great. I just noticed last night the problems. We have had some heavy rain the last few days and first thought maybe the balun box on the bottom of the antenna was cracked. It has stopped raining today so I will try it tonight. I also plan on taking a look at the antenna itself to make sure nothing has cracked. Can't really see how it would. I am going to take the station apart completely and reassemble it, eliminating any cables I don't need.

Can anyone tell me if the cables connectors themselves should be shorted to the braid or does it make a difference?

Max

Rick,

This got me thinking..if I am feeding the electret element and audio through only the hot wire and ground, do I really need this third wire (the black one) in the cord at all? Perhaps if it is hooked up at only one end it may be inducing a ground loop. I should try disconnecting from the connectors at both ends and leave it unattached in the cord.

Hopefully I will have some time to work on it tonight. I can't see the antenna at fault as it is only happening on one band and only when the mic is used. As mentioned before feeding PSK signals into the rig causes no problems whatsoever.

Hi Max,

I wonder if you have a ground loop where all your equipment is not at the same ground potential and is exacerbated by all the rain. Is everything in your shack connected to the same earth ground?

In my case the RFI problem would lessen if I touched the mic itself and completely go away if I covered the mic plug with my hand. I can only guess the mic shield was at different ground potential than the chassis ground and by connecting the mic shield to the plug itself fixed it....Had me scratching my head for a while.
I think by unplugging your wall wart to the rigblaster you are removing the shield ground to the case of the rigblaster and RF is getting in.

Max.

I have been following along with most of you description of the RFI/Grounding problem you are experiencing. Without any knowledge of your physical circumstances in the house, equipment arrangement, feedlines and antennas, I would make one general recommendation. If you don't already have it, install a good single point bonding system for all your equipment at your operating equipment location. You should use something like a small aluminum or copper plate mounted in a convenient location at the rear of your equipment, and then run separate bonding conductors from each piece of equipment to the aluminum/copper common bonding point. An insulated braid or fairly large wire (#12 or larger). This takes care of bonding all the equipment together from a safety viewpoint. If you have coax feedlines that you do not disconnect when not in use, then the outside shields of these coax feedlines should also be bonded to the common bonding point just like the equipment. For example, all my coax feedlines come into coax switches which disconnect the center conductors when not in use, and the metal housing of the switches is bonded to my common bonding point. I also ground the center conductor of the main coax feeder going to my equipment with a separate coax switch located on the equipment side of my antenna selection switch. If you have an actual grounding conductor coming to your shack, it should be connected to the common bonding plate. In my case, my shack is located in an interior room inside the house with no short distance, good access to a good ground. I use the shield of one of my 7/8" hardlines going out to my tower as a kind of grounding conductor (not optimum, just about all I can do) that connects to the ground system at the base of my tower. About 4 years ago my tower took a direct lightning strike that blew half of my Ringo Ranger antenna off the top of the tower. The only damage to my station was the transistor preamp on my 450MHz repeater - repair $25.

My view of station bonding and grounding is like making sure the lights work when I connect a trailer to my truck. If you don't get a good bond/ground between the trailer and the towing vehicle, you can go crazy trying to trouble-shoot why the lights don't work.

If you have already taken care of all this signal/safety grounding, I'm sorry to have wasted your time. But, having a good grounding system will help you eliminate many weird problems and let you focus on real problems that you need to find in your equipment and interconnecting wiring. Your real problem could well be the antenna or it's feedline condition (or length).

Good luck, and have fun Max.

> Your shack must not be in the RF envelope with the horizontal antenna but is with the vertical. I had the same problem with a microphone. ..The RFI would also almost go away when I would touch the mic. Turned out to be a grounding problem with the microphone plug itself .. I fixed my problem when I grounded the mic plug... I clipped 1.5" piece of wire off a 1/4 watt resistor. Open the mic plug up and solder one end of this wire to pin 4 along with the mic shield wire. Run the wire out the back of the plug when you assemble it and loop it under one of the screws to the clamp portion of the mic plug. RFI went away. Mine was also on 20 meters by the way. Which antenna were you using last weekend when we spoke? I sure didn't detect any RF in your signal.
>
> Rick KC0HH

Hi Rick,

I was on the vertical that is causing me the grief now. Two days ago I had no trouble, then just last night it started. I thought it must be because of the rain. The XLR plug on the mic itself has three wires, audio hot, audio ground (braid) and black ground. I ran a ground wire from the black wire to the mic plug itself. If I grab the mic the RF goes away as well.

I am going to tear the station apart tonight and put it back together on piece at a time and run tests along the way. I don't understand why it would start all of a sudden. What good does it do by grounding the mic plugs themselves? My mic plugs into the RigBlaster and then nto the radio.

I guess the only thing is to start over.

MAX
the best way to get rid of stray rf is to find the
offending freq. and find it's actual length get a
piece of rg-58 short both conductors on one end
multiply the voloicty factor like .66 times the actual
length cut it to that length and make sure the
conductors on the other end are not touching.this is
almost a sure fire
cure.

I appreciate all the comments and suggestions. My only concern is that this has never been a problem for me and nothing in the shack had been changes to cause it to happen. Like it just started happening for no particular reason. But I think what I will do is take everything apart tonight and start over. I will dress every cable correctly and neatly and shorten some up if I have to. I will put in a common ground as suggested and verify the outcome on the air as I progress. Eventually I will find the cause of the problem. I just don't understand why it would happen for now reason. The only thing that could have happened is the rain.

Thanks again for all the help.

Max,
I have the R-7000 and It was giving me RF problems in the shack.
Mine turned out to be bad Coax that would Only Arc when the power output was above 60 or 70 watts. Below that, It would be fine. I also had my 20/30 meter trap develop an arc thru the inner plastic form that the coil is wound on inside the trap that would make the SWR change as I increased the power. I replaced the trap and the problem was solved. I then took the old trap completely apart and ground out all the Arcing marks on the Coil form and rebuild the form using JB Weld. It now works great again also. How is your SWR on the R-7 as you increase the Power level out?? Is your the R-7 or the R-7000 like mine ?

Max:
This is all typical of RF. Be sure that you have a ground on the rig. Tun a wire from the rig to a cold water pipe in the furnace room or if none is available try grounding to the furnace ducts.

Yes it is Walt. I don't have any other mic to test, but it does not do it on digital modes. I moved some equipment around this morning and noted the following, and don't laugh...

When I pull the desk out from the wall, it goes away almost 100%.

If I unplug the wall wart to my rigblaster, it gets worse.

I also have an extension cord that runs through the wall under the desk into the furnace room where my power supply used to sit. right now it is not plugged into anything but is still plugged into the AC socket. If I unplug it from the wall socket it gets worse, yest it has no connection to the setup at all. Which leads me to think it is a grounding problem. But why would it not do it on my other antenna?

Mine is the R7 Gordon. I find the SWR goes up in the rain but most
antennas will. As far the RF is concerned, I may have found the
problem. The rig is grounded to the computer, but the RigBlaster is
between the two in the mic line. I ran a ground wire from the case of
the RigBlaster to the 830 and the RF immediately went away. Hopefully
I have found the problem. I was quickly fiddling with it on my lunch
hour but had to get back to work. My "real" job keeps interfering with
my "dream" job!

Did it seem to flush anything out? or did it just lubricate deep like a penetrating oil such as tapping oil?

10993. [TS-520_820_530_830] TS-820S Transmit Problem - Update#2

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-18 03:01:04 UTC
From: Stephen Davis
Topic: 10950 Message: 10993

Hello All,

I have replaced the screen and cathode resistors. Both cathode resistors (R2 and R3) were open. The screen resistors were okay, but replaced them anyway. I have not fired up the rig yet as I am still not sure what caused the resistors to open. As stated in my last update, the tubes checked good when I tried them in my TS-530, so I think that rules out the tubes as the culprit.

In looking at the Final Board circuit diagram, I see a point marked "K" at the edge of the diagram. On the Final Board PC layout, there is no point "K" that I can see. I think "K" stands for cathode. Does anyone know what is on the other side of point "K"? On the large overall schematic, there is no point "K" shown in the final section. Sorry if that is confusing. Here is what I am thinking... One side of R2 and R3 is grounded. It looks like the other side is connected to pins 1,4, and 6 of the finals and to point K. So it does not seem like much can go wrong on the final board itself, except for a shorted tube, which I don't think is the case. So I am thinking the problem must lie beyond point "k", but don't know how to find it on the schematic.

I don't have a lot of experience, so it the above assumption is wrong, incomplete, or way out in left field, please don't hesitate to correct me!! Any help or suggestions appreciated.

Thanks

Steve K7QHU

Subject: [TS-520_820_530_830] TS-820S Transmit Problem - Update#1

Walt and John,

Thanks for your reply's. I did not get a chance to pick up the resistors today. However, I wanted to make some progress, so I decided to take the tubes from the 820 that we suspected might be shorted and try them in my TS-530. I had check the tubes for shorts after reading Walt's primer in the archives and found no shorts. The finals by the way are the original S2001A's. Anyway, I put them into the TS-530, hooked up the dummy load and powered up. I let the tubes warm up for about 5 minutes. I check the bias and it was a little high, so I adjusted to 60ma. I then went through the

tune-up procedure, keeping a wary eye on the rig. The rig tuned up fine and I was getting full output on 40 meters. I spent about ten minutes, using a CW key to send into the dummy load every so often. The tubes seem to be okay. Didn't want to run for too long as I did not want to neutralize them in the 530. So, it seems the problem is not with the finals, which is kind of disappointing because this means there is a more difficult problem to track down. My next step will be to check the tube sockets for any shorts. Any other suggestions would be welcome.

Thanks

Steve K7QHU

Stephen, after you replace the resistors with the proper wattage and value, try to to use a different pair of tubes that are known to be good.

Stephen Davis <sdavis@beachnet. <mailto:sdavis%40beachnet.com> com> wrote:
Hello All,

I picked up a Kenwood TS-820S a couple of weeks ago and was told that it would not transmit. I finally had a chance this evening to take a look at it. I fired it up, hooked it to a dummy load and let it warm up. After about 5 minutes, I went through the tune-up procedure and sure enough, no output. The meter showed I did have 60ma of bias and about 850 volts HV. I unplugged it, took the covers off and had a look. First thing I noticed was that the cathode and screen resistors looked new. Visual inspection did not turn up any obvious problems. Next I took a look at the transmit relay and it looked okay. I then plugged in the power cord, and turned the radio on. Heaters on all three tubes were glowing. I put the function switch into tune mode and flipped the xmit switch and observed that the transmitter relay was opening and closing as I went from receive to transmit and back again. I then decided to go through the tune-up procedure again. I put the mode switch to CW and the xmit/receive switch to xmit. I got distracted for a couple of seconds and turned away from the radio. As I turned back towards the radio, I heard three distinct "pops" and saw three blue flashes come from the xmit board. After coming back down from the ceiling (it really startled me!!) I unplugged the radio and took a look. R3 (10 ohm, 1 watt) had pits in it were little pieces had apparently been blown out of it! R2, R5, and R6 looked okay. I plan to replace all four of these (need to make a trip to Radio Shack tomorrow).

But, before I replace the resistors, I need help in figuring out what is causing the resistor(s) to blow. I am thinking a bad final tube, but would appreciate any thoughts the group might have on this or any troubleshooting tips.

Thanks,

Steve K7QHU

> I have been following along with most of you description of the RFI/Grounding problem you are experiencing. Without any knowledge of your physical circumstances in the house, equipment arrangement, feedlines and antennas, I would make one general recommendation. If you don't already have it, install a good single point bonding system for all your equipment at your operating equipment location. You should use something like a small aluminum or copper plate mounted in a convenient location at the rear of your equipment, and then run separate bonding conductors from each piece of equipment to the aluminum/copper common bonding point. An insulated braid or fairly large wire (#12 or larger). This takes care of bonding all the equipment together from a safety viewpoint.

Bill & Max
For my common ground system I simply used a length of 1/2 inch copper water pipe. Easy to drill and use self tapping screws for the individual connections to each piece of equipment. Thanks for the tip on grounding the coax shields.
regards
Barry

Hi Max,

I always use the third wire for chassis ground besides mic audio and mic ground, especially with the electret element. Besides having a much higher output it also seems to pick up RF easier. I think you are feeding the B+ for the electret from the RigBlaster. It makes sense that the RigBlaster case would have to be shielded better than just thru the wall wart.

The reason your antenna came into play with the RF problem is the rain. Not to pick on Cushcraft but just because the antenna has a good SWR does not mean it is efficient. I have read studies that 50% of your RF with the R7 is warming the earthworms. And that is with normal soil conductivity. Out here in the desert sand the figure goes up to 65%. With your ground staturated with water the efficiency goes up to like 90% with more RF going out towards the horizon including your shack.. The RFI will lessen when the ground dries out. Good way to check your antenna efficiency. Assuming you have everything waterproofed, If your SWR goes up and the bandwidth narrows when it rains, you have a poor radial (ground) system.

Rick KC0HH

ve3tmt <ve3tmt@...> wrote:
Rick,

This got me thinking..if I am feeding the electret element and audio
through only the hot wire and ground, do I really need this third wire
(the black one) in the cord at all? Perhaps if it is hooked up at
only one end it may be inducing a ground loop. I should try
disconnecting from the connectors at both ends and leave it unattached
in the cord.

Hopefully I will have some time to work on it tonight. I can't see the
antenna at fault as it is only happening on one band and only when the
mic is used. As mentioned before feeding PSK signals into the rig
causes no problems whatsoever.

Max

Date: 2006-11-18 21:17:46 UTC
From: wb3bqo
Topic: 10999 Message: 10999

Gentlemen! I have run the TS-520 since the '70s. It was bought used and it has a digital readout with 3 7-segment LEDs over the main tuning knob. I was told that this was a mod installed by a very big radio store in the LA area. Until now it has worked very well. Then, last week, it ceased to function. The readout display has random characters and won't change when the frequency is changed. I've checked for voltages from the 9-volt supply and also the frequency supplied by the big crystal at the left-rear of the chassis. All appears normal.
I have no schematic or other information on the display so am afraid to do any more testing without a road map.
Can anyone shed some light on where to obtain a schematic and maybe some history on this truely ancient readout?
Thanks & 73,

Pete Carr WW3O

Hey Max,

You can help out the soil conductivity with several pounds of rock salt...It is kind of hard on the lawn though...Do you have any chain link fence in the yard? It makes a pretty good counterpoise.

Three weeks ago I found a New In the Box DFC 230 Frequency controller
for my TS 830
this unit was in the box never opened for over 20 years
Worked great for 3 weeks. last night the digital read out of the DFC-
230 is ok and changes except the radio went to 2.265.1
when I was on 160 meters. I guess maybe a bad cap after 20 years or the
PLL came unlocked ?

Anyone have experience on the DFC 230 I have the op manual with sket..
one voltage is in question but I think its a miss print in the manual
Perry wa8thk
thanks

Does anyone know what the value of the choke in the RF compartment
in the TS-830S in the final unit that goes from the second pin of the
5 pin connector between the two 6146's to ground is.

I cooked the coils on the resistor and my output and ALC have
gone way off. If so where can I get one?

I received help from Ken K4EAA. Thanks! Ken so much!

I ordered (3) from Mouser.

Also I found that without this choke that my ALC and IP max and dip better now.
It was always harder to find the dip on 80m before.
So I believe it may have been failing since troubles earlier.

Just for your info in case some one else encounters this problem....
I hope you don't mind Ken, my quoting here.
Anyhow here is what he said:

It is a pi-wound 470uH choke.
They use different chokes in different Kenwood hybrids.
It has a high impedence to HF frequencies but low resistance to DC.
It bleeds off DC.
It is a safety choke.

Anyhow, I see better IP dip now, ALC and my output is back to what it
should be without it in place, at least until I get the one I ordered.
It is a "dollar" item.

11014. "run away" carrier control

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-20 12:19:57 UTC
From: cobra04106
Topic: 11014 Message: 11014

I have a 520 and when I start it up, according to the manual, I blow the fuse. After many fuse replacements, and trial and error, I found out that I could get full output with the carrier control at about one and a half. If I go over,and its very touchy, the power output will skyrocket and blow out the fuse. The radio works fine but it takes some finessing. Do I need a new pot? Also I get alot of fan noise, compared to my friends 520. I have cleaned and oiled mine. Maybe his shack is noisier and the fan noise seems lesser but I have eared it pretty good and its silent compared to mine. Any help would be appreciated.

I did a little "googling" today looking to see if I could
find a direct replacement for that 470uh choke.
kenwood Part number L40-4711-03 shows up at

http://www.kenwoodparts.com/

Change Qty. Item Description Price
L40-4711-03 470UH FERRI-INDUCTOR $1.23
Subtotal $1.23

I didn't know this place existed.

Hi All,

Thanks to allowing me join this group.

As a owner of a TS-830, I am glad to be able to find this group, and hopefully help with advice, and also receive.

Today, I am in the need of help.

My TS-830, in my care for 5 years, has decided in the past few days to stop transmitting. The last activity was the CQWW contest a few weeks back. The next time I tried using it, I got very little, to no power output. Now I get nothing, bias has even dropped to nothing, well only about 5-10ma, it had been sitting steady on 60ma, as the manual mentions without any problem.

I am guessing the tubes have died, and will need replacing?
I know they are 6146B's, and have checked on eBay and found 6146W's. What are the differnce between these type? I did hear that the "B" are better?

One comment I received during the contest, was that he could hear a buzz on the TX. Might of been the start of it's death. :(

Any help of any sort would be grateful, wish to get the radio back working, and operating.

Regards
Kevin, ZL1KFM

Kevin:
I doubt that it is the tubes. With your meter switch on HV what is your high voltage?

It should be in the area of 800 V. If it is low like 400 V you have bad High voltage filter capacitors C-22 and c-24 or a bad diode, D1,D2,D3,D4.

If the high voltage reads correctly, take the cover off of the rig and measure the voltage at the point labeled SG on the bottom of the final board. It should read a bit over 200 VDC.

Use caution around the rectifier board, the capacitors, and the transformer as well as inside of the final unit. There is 800 Volts there.

Does the rig get a normal ALC reading with the meter switch on ALC when tuning up and peaking the drive control ?

Let us know the results from the above.

Date: 2006-11-21 09:43:13 UTC
From: rodgerbryce
Topic: 11024 Message: 11024

Hello all, I am very pleased to have found this web site dedicated to the Kenwood range of hybrid transceiver.

I have a TS530s which I purchased new in 1981, unfortunately I am beginning to have problems, as follows:

The 6146B's were changed several years ago, by some one 'who new what they were doing'within 2 hours of operating time, I saw smoke and switched off the rig. On inspection one of the valves had gone, but couldn't really see any more than that.

I used the rig for receiving for a number of years after that, but have decided I wish to try and get the old girl up and running again.I installed a new matched pair of valves and get the following output:

3.700: 25 watts
7.050: 5.6 watts
10.110: 91 watts
14.200: 98 watts
18.110: 91 watts
21.205: 20 watts
24.910: zero
28.400: zero

The valves have not been neutralised as I cannot get any power on 28 Mhz.

I have little or no experience with valve rigs, so any advice on trying to trace the cause of the problem would be gratefully received.

Tnx, de Rodger/GM3JOB.

Here is my guess:
R-2 R-3 R-4, R-5 on the final unit board are 20 ohm 1 watt. They are in parallel. So they will read 5 ohms in circuit. I believe that these were probably damaged when the final flashed over. Replace them with original type 20 ohm 1 watt. DO NOT increase the wattage of them as they act as a fuse to avoid damage if a final flashes over. If the wattage is increased, you will loose this protection.

I also believe that the shaft coupling that connects the front bandswitch shaft to the rear bandswitch shaft in the final cage has deteriorated over the years. This has allowed the rear bandswitch wafers to get out of line with the front ones. In essence, the rear bandswitch wafers are switched to the wrong band. If this condition exists, do not attempt to transmit until this is corrected.

Go to the files section of this group. Go to repairs and alignments folder. Go to Flex Bandswitch Coupling Repl PDF.

This has pictures and everything posted by Bill K0ZL. Although it is for the 830, the 530 is very much alike in this area.

11026. Re: [TS-520_820_530_830] "run away" carrier control

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-21 11:17:25 UTC
From: n9wb
Topic: 11014 Message: 11026

What do you call "full output" ?
What do you call "the power output will
skyrocket" ? to how many watts?

The first thing that I would do is go to the files section and look at the article "Save your Transformer". Build a light bulb tester to keep you power transformer from being abused until you resolve this problem.

First I must ask this question. Are you operating it on 120 V. I don't know where you live and I am considering the possability that you may have the switch on the back set for 110 volts when using 220 to 240 volts.

Is your idle current set to 60 MA as specified?

Does it do this on 40 meters into a dummy load? Are you measuring the power on an external watt meter. Will it test the SWR while on a dummy load ?

If you switch your meter it HV what does it read on transmit?

Please answer the above and we will scratch our heads and go from there.

Subject: [TS-520_820_530_830] "run away" carrier control

I have a 520 and when I start it up, according to the manual, I blow the fuse. After many fuse replacements, and trial and error, I found out that I could get full output with the carrier control at about one and a half. If I go over,and its very touchy, the power output will skyrocket and blow out the fuse. The radio works fine but it takes some finessing. Do I need a new pot? Also I get alot of fan noise, compared to my friends 520. I have cleaned and oiled mine. Maybe his shack is noisier and the fan noise seems lesser but I have eared it pretty good and its silent compared to mine. Any help would be appreciated.

11031. Web Site TRI-FLOW OILS

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-21 17:25:40 UTC
From: N3DOK
Topic: 11031 Message: 11031

To members of the TS-830S Yahoo Mail List.

Hi, Here is the website for TRI-FLOW. They have several different types of products.
http://www.triflowlubricants.com/index.html

I Have no interest in any of these products. The name TRI-Flow oil has been brought up at times. I wanted to find out what type of a product it is. Now you can decide if it can be used on any of the Kenwood's. I have not found this product in the Pittsburgh PA area.
Bob N3DOK

Superior Lubricant Drip Bottle
Tri-Flow Superior Lubricant provides twice the lubricating power of most competitive brands. Its light viscosity allows for deep penetration into hard to reach moving parts. High grade petroleum oils provide optimum lubrication under extreme temperatures (-60 to 475F) and humidity. Formulated solvents soften and remove dirt and contaminants, while special additives displace moisture and prevent rust and corrosion.

USAGE:
. Ideal for loosening rusted and corroded nuts and bolts
. Excellent for lubricating chains and all pivot points

RECOMMENDED CONDITIONS:
. Ideal for all conditions - wet, dry, road and trail

Superior Dry Lubricant
Tri-Flow Superior Dry Lubricant was specifically designed to lubricate like an oil and stay clean like a wax. Its exclusive formula includes paraffin wax and high grade petroleum oil which penetrates as it quickly sets up and dries, leaving a thin, visible, coating that repels water as it lubricates. Adhesion promoters dramatically reduce shedding, increasing the length of time before reapplication. Special additives displace moisture and eliminate the potential for rust and corrosion, while an inherent anti-static agent works to repel dirt and dust under extremely arid and dry conditions.

USAGE:
. Great for lubricating all pivot points
. Specifically designed for lubricating chains

RECOMMENDED CONDITIONS:
. Ideal for extreme conditions - wet, dry, road
and trail

High Performance Synthetic Grease
Tri-Flow High Performance Synthetic Grease is specially formulated to lubricate any surface that slides, glides, rolls, twists, turns or spins. This non-melting, waterproof formula is designed to seal out water and contaminates and prevent rust and corrosion under extreme temperatures (110 to 400F). This pure synthetic grease is fully compatible with most rubbers and plastics. It is available in a squeeze tube that fits most injection

systems.

USAGE:
. Great for o-ring seals
. Ideal for packing wheel bearings
. Excellent for stringing cables

RECOMMENDED CONDITIONS:
. Ideal for all conditions - wet, dry, road and trail

Citrus Cleaner/Degreaser
Quickly clean and degrease even the dirtiest drivetrains with Tri-Flow Citrus Cleaner/Degreaser. Its high velocity, precision valve blasts dirt and debris while the powerful foaming action loosens grease, oil and hardened deposits, leaving surfaces clean and residue free. Designed with the environment in mind, this water-soluble, biodegradable, citrus-based formula can easily be rinsed with water.

USAGE:
. Best for cleaning mounted drivetrains
. Great for soaking gunked up parts and tools
. Ideal for use with parts washers
. Excellent for use with chain cleaners

Rapid Clean Dry Degreaser
Tri-Flow Rapid Clean Dry Degreaser is a premium formula with an attached high velocity trigger valve that blasts away dirt, mud, grease and oil. Leaves no contaminant-attracting residue or chlorinated solvent run-off. Cleans surface and degreases quickly.

USAGE:
. Ideal for bikes/motorcycles, linkage, chains, fishing reels, nuts/bolts, caliper discs, skates/boards, firearms, cables, sewing machines, brake shoes, machines, all-purpose parts cleaning.

From: frnklyn_brwn
Topic: 11032 Message: 11032

Hello all..I am a new member and new owner of a TS-520S.

I have been away from tubes for quit awhile and am trying to
understand the physics of what is going on during the
tune up procedure (current/voltages etc).

I have reviewed various tech publications (including ARRL and
internet web sites) but am still hazy.

This is a great forum. I have leaned a lot on the couple
of weeks I have been following it.

Gentlemen. I had posted a message looking for the schematic for a TS-520 digital readout and am still looking. However, I e-mailed Henry Radio and just received a message from Ted Henry himself. They had scoured the files and were not able to find the schematic. Ted mentioned that they had not had a request for readout data in over 5 years. I may have the last remaining one!
Anyway, it was very thoughtful of Ted to respond. I appreciate his taking time let me know that they had looked. There are some truely fine gentlemen in this hobby!

With the limited information you have provided and with some
experience with a similiar problem with Heathkit
transmitters/transceivers, I'll take a stab at the problem. It
appears to be a carrier null problem.

You've given us the symptom but we need additional information to
help you with your problem. My thoughts are pure guess work and is
based solely on experience with a smiliar problem with Heathkit gear.
Therefore, please give us some more info.

Pete your right about that. It shows how difficult it's getting to find information on certain aspects of our Kenwood Tube Hybrids (and some parts as well). It's times like this are when we resort to alternatives.

I see two options if it were me. Adapt a frequency counter from another unit or use a frequency counter purchased separately and monitor it from outside the radio. The second option would be the way I'd opt to go. At least until I found another frequency counter if I was that serious about the unit.

It was good of him to respond and it shows the dedication to the product and service. Unfortunately it also shows the difficulty in finding the resource you require.

Pete, I just looked over in the BAMA manuals section for Kenwood products and they have information for the digital Display for the TS-520. There are two displays apparently listed. The one is the harder to find display that you could originally obtain for the 520 which was provided courtesy of James Marolda here in our group and the other seems to be an aftermarket product called DG-5, which seems mainly used for the 520 S and SE Radios. Is this what your looking for?

Roger, check the grid resistors inside. Look fir obvious damage. they'll read 20 ohms if they're good or 10 as a pair. They are one watt size. Use the same as they are like a fuse to keep from damaging something more costly.

rodgerbryce <gm3job@...> wrote: Hello all, I am very pleased to have found this web site dedicated
to the Kenwood range of hybrid transceiver.

I have a TS530s which I purchased new in 1981, unfortunately I am
beginning to have problems, as follows:

The 6146B's were changed several years ago, by some one 'who new
what they were doing'within 2 hours of operating time, I saw smoke
and switched off the rig. On inspection one of the valves had gone,
but couldn't really see any more than that.

I used the rig for receiving for a number of years after that, but
have decided I wish to try and get the old girl up and running
again.I installed a new matched pair of valves and get the following
output:

3.700: 25 watts
7.050: 5.6 watts
10.110: 91 watts
14.200: 98 watts
18.110: 91 watts
21.205: 20 watts
24.910: zero
28.400: zero

The valves have not been neutralised as I cannot get any power on 28
Mhz.

I have little or no experience with valve rigs, so any advice on
trying to trace the cause of the problem would be gratefully
received.

Tnx, de Rodger/GM3JOB.

From: John Harp
Topic: 11022 Message: 11044

Hi Kevin, I'm John. KA3DPW. I'e got 830's. Something that happens with these radios is that occasionally the Filter Caps may go bad in them. Check your filter caps. Check your diodes too. My bet is the filter caps.

Kevin <sparcnz@...> wrote: Hi All,

Thanks to allowing me join this group.

As a owner of a TS-830, I am glad to be able to find this group, and hopefully help with advice, and also receive.

Today, I am in the need of help.

My TS-830, in my care for 5 years, has decided in the past few days to stop transmitting. The last activity was the CQWW contest a few weeks back. The next time I tried using it, I got very little, to no power output. Now I get nothing, bias has even dropped to nothing, well only about 5-10ma, it had been sitting steady on 60ma, as the manual mentions without any problem.

I am guessing the tubes have died, and will need replacing?
I know they are 6146B's, and have checked on eBay and found 6146W's. What are the differnce between these type? I did hear that the "B" are better?

One comment I received during the contest, was that he could hear a buzz on the TX. Might of been the start of it's death. :(

Any help of any sort would be grateful, wish to get the radio back working, and operating.

Regards
Kevin, ZL1KFM

I remember talking with you about it. I think it was neutralization. Glad to see your doing well with yours.

I'm changing mic and adding ALC limiter soon to mine. Got a transverter to wire as well. Stock up on winter projects.

Hello to the group. Just joined within the last two weeks, and have
been lurking and learning. Recently aquired a TS-520s, and TS-820s
both in excellent condition.(I am currently bunking in with the dog).
On the 820s the black tube sheild is missing from 12By7A tube. The
ground strap is still there. How important is the metal sheild on the
tube? I think I read somewhere on the some other radios they were
removed because of heat, but not sure. If it is a must I would think
it could be found or even made. Thanks and hello

It should not make any difference what band you are on as it is in the IF. However, to be sure, on 17 meters, try peaking L-19 for maximum receive on a weak signal. Then adjust L-20 clockwise past the peak and back CCW to the peak. Re-peak L-19 until it peaks and then adjust L-20 clockwise past the peak and then back ccw to the peak.

Repeat the above until no improvement is obtained.

If 17 meters is still weaker, see if peaking the Drive control for maximum receive brings it to the proper level. If it does, is this different than the position of the drive control for maximum ALC on CW transmit ?

If readjusting the Drive control does not help, are you sure the receive sensitivity is low or could it be band conditions or your antenna ? How does the marker signal level compare between 20 meters, 17 meters, and 15 meters? Use a 100 kHz point on each band for comparison. Tune in the marker for maximum. Also peak the drive for maximum receive. Use a dummy load when checking this. If a dummy load is not available, disconnect the antenna lead.

Have you ever adjusted the 18 MHz coils on the coil pack board ? If so, they may not be adjusted properly. If you have not adjusted them, I would suggest that you do not until we investigate further.

From: rodgerbryce
Topic: 11024 Message: 11049

Thanks to N9WB & KA3DPW for their input on my problems, based on their advice and a more detailed examination, I have found the following:

1. Resistors 2,3,4 & 5 appear to be alright visually, no signs of any damage.

2.The bandswitch located within the PA compartment is not moving, the inoming shaft is turning at the flexible coupler. I do not have an allen key of the right size as yet to try and tighten the set screws.(not surprising I blew a valve!)
Assuming I can tighten the existing or have to replace the coupler how do I go about setting it all back up again??

3.At the bottom of the final choke within the PA compartment, there is a 0.01uF capacitor which goes to ground and what appears to be choke which goes to the 800v connection on the bottom side.I think it is L1 a 6.8uh choke, it has been severely overheating judging by the colour of it, green at the ends black in the middle, does anyone know what sort of resistance value I should get through this??

Thanks in advance for any information.

73 de Rodger/GM3JOB

11050. TS-830M Low RX Audio and Good Sensitivity

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-22 12:49:44 UTC
From: Giuseppe Bisesti
Topic: 11050 Message: 11050

Hi everybody,

i experienced a trouble i didn't yet find on the net. I post the solution i found for sake of experience sharing.

The ts830m is an european version of the rig whith am capability instead of narrow cw capability.

The symptom was audio very weak on SSB/CW rx but good sensitivity (smeter showed the right indications on cal position). On tx the monitor audio level was really ok. The audio level was also good on am rx.

A quick look at the schematics showed that in the rx section there is an additional board for am detection. The board is readily accessible simply removing the top rig cover.

During the ssb and cw reception that board is bypassed by a dpdt dil relay, while the signal coming from monitor detection circuitry is directly fed to the audio amp just after the am board.

So, the solution is very simple: substitute the relay. It's a commonly avalaible and cheap relay. So no reason, for me, to try to clean it. Simply substituted.

Hope all above of some interest for someone.

73's de i8vye/0 (Joe)

I am not 100% sure if I have a proplem with 17m. On 40 and 20m I always have a noise floor from 4-6 db. On 17m I have a noise floor of o db all the time. I hear stations on 17m from 1-6 db. I have a bigg steppIR Vert. antenna. The SWR is very good on all bands.I have not done the marker signal. I need to read the book to learn how to do this.It would be nice if my 520 had 17m to use as a signal gen. Peaking for a weak signal on 17m with the band going in and out so fast will be fun. I have never adjusted the 18 MHZ coils only L-19 and L-20. thanks..
Chris..

n9wb <n9wb@...> wrote: It should not make any difference what band you are on as it is in the IF.
However, to be sure, on 17 meters, try peaking L-19 for maximum receive on a weak signal. Then adjust L-20 clockwise past the peak and back CCW to the peak. Re-peak L-19 until it peaks and then adjust L-20 clockwise past the peak and then back ccw to the peak.

was that serious about the unit.
>
I bought a non-working 80Mhz counter from Fleabay for $10. Risky yes.
On plugging it in it did not work so checked and 5V supply was at
2.5V. Followed the land or copper trace out from the regulator till it
split in two. Cut one of these and the regulator came up to 5V.
Bridged that cut and moved to the next Y along the BO trace and
repeated. Fifteen minutes work and a bad electrolytic was isolated and
replaced. Sure the unit now has some solder bridges on the copper runs
but I don't really mind as it is only a support device and not part of
the main station. Tried a BNC antenna but with 4 radios at the bench
the reading was not too stable. Found that a piece of coax wound
around the transmission line coax is working OK till some more
permanent solution is devised.
regards
Barry in Vancouver

Topic: 11054 Message: 11054

Thank you for the welcome. I do have the owners manual plus some other downloads that explain the tune-up procedure. Since my rig is new to me I am trying to understand what is going on rather than just follow the procedure "recipe style"

With regard to the plate idle current isn't the 60 ma kenwood suggests an arbitrary figure? It seems to me you could set this within a wide variation subject to physicaly overheating the cathode/plate elements. Does the 60ma pre-set have an effect on the linearity of the response or determine the class of amplifier.

On the same subject what is the "bias pot" adjustment for required 60ma idle plate current? Is it a variable resistor that controls grid voltage and therefore bias or is it a resistor in the plate circuit that controls plate potential and indirectly grid bias (or non of the above)?

Thanks..

Frank

Just got a nice looking 830s with the same problem. Checked and found no 800 volts. Can someone suggest an appropriate replacement for the four diodes (the schematic shows VO8J or V08J and I haven't found it listed in my cross-reference guides)? Also, I know there was a suitable replacement listed awhile back for the the filter caps--would someone let me know that info as well? Might as well change out those. Yep, my archive search was extremely limited.

Hi Kevin, I'm John. KA3DPW. I'e got 830's. Something that happens with these radios is that occasionally the Filter Caps may go bad in them. Check your filter caps. Check your diodes too. My bet is the filter caps.

The VO8J diodes are rated at 1000v @ 1.1 amps
The VO6E diodes are 400 V @ 1.1 Amp
The VO3C diodes are 200 @ 1.3 amps

I would think the VO8J could be substitued by a NTE-156 as it is rated
1000V @ 2 Amps.

I haven't looked up any crosses for the other 2, but it shouldn't be
difficult to find some that at least meet the requirements.

Jack,
I have a couple of extra cans. I paid $ 17.00 each for them
including shipping. I'll sell you one for that price if you can't find
any .
The Color is a Perfect Match!

The VO8J diodes are rated at 1000v @ 1.1 amps
The VO6E diodes are 400 V @ 1.1 Amp
The VO3C diodes are 200 @ 1.3 amps

I would think the VO8J could be substitued by a NTE-156 as it is rated
1000V @ 2 Amps.

I haven't looked up any crosses for the other 2, but it shouldn't be
difficult to find some that at least meet the requirements.

Hi Ruben,
I tried using that sitem, but couldn't make heads nor tails of how to
use it to actually find the VO8J diode. I see it on the first page, but
then tried going to the cross reference with NO luck.
Can you tell me what I am doing wrong over there?

Hello Gordon ...try this : http://www.loadparts.com/download/download.asp

It's actually a cross reference utility and it also finds the supplier.
By the way...The number is V0 not VO, I believe that the guys are
typing in an "O'" oscar intead of "0" zero for the number and that's why
they're having problems finding it. V08J= Victor Zero Eight Juliet .....

The Shure element is much too large to fit in a D-104 mic head. If the D-104 you have has the amplified base, the Heil element sould work, I am pretty sure it is a low impedance element though so if you have an un-amplified base, you would seriously underdrive the Kenwood. The electret element Max refers to has more than enough drive for the Kenwood but you need B+ for it.

Max, you are still having an RFI issue? Is the RigBlaster not shielded? Have you tried plugging the mic directly into the Kenwood to see if the RFI clears up?

I am in the process of wiring up an electret element to my 830. It's
been working and when it does it sounds great. I am relocating the
guts to a separate enclose to stop the RF problem I've been experiencing.

Try the Heil HC-104 kit form Heil Sound Ltd. this is a kit to replace a
bad element in the D-104 head. Good audio also!!

I will get back with you more when I have time. Is it an amplified D-104 ? What is wrong with the element?

1.Remove the back plate from the head. There is foam that insulates the element leads from the back. This deteriorates and shorts out the element.
2. Another failure is that the glue in the center of the element that connects the post to the center of the diaphragm breaks loose. You need a magnifying glass to inspect it. the glue is heat soluble so you can heat it with a soldering iron and re-melt it. Use only as much heat as necessary at too much heat can damage the ceramic crystal.

The Heil HC-5 is a good replacement choice, I have just replaced one with a $2.00 Electret element from radio shack.

Tell us more and we can come up with ideas.

There are several D-104 mic elements on E-Bay. One is for $13.00 shipped. Here is the link.
http://cgi.ebay.com/ASTATIC-D104-REPLACEMENT-MIC-MICROPHONE-ELEMENT_W0QQitemZ180053555214QQihZ008QQcategoryZ48707QQssPageNameZWDVWQQrdZ1QQcmdZViewItem

If you have the amplified base, you can use a Radio Shack 276-090 electret element (~$3.00) that sounds really good with the Kenwoods and has plenty of drive. I made a round cardboard disk and mounted the element in the center to put in the mic head. Use the 9 volt battery in the base to power the electret. Use some foam rubber in front of the element to reduce breath blasts as it is pretty sensitive.

Hi all and thanks to the moderators of the group who allowed me to join. My Dad and step-brother recently gave me some awesome equipment that they are not using. Both are hams (as am I) and they are no longer active for a variatey of reasons. My step brother GAVE me his TS-830S, MFJ Bencher paddle with keyer, MFJ 300 watt dummy load, MC-50 Desk mic and Vectronics (MFJ) tuner and a Silver Eagle D-104 mic. My dad thru in a G5RV, and a REAL J-38 Key (I've had my eye on that for years, and he told me that in the 1950's those were sold at local Detroit area ham stores by the barrel for about 50 cents!!!) I've been to Dayton many times and seen J-38's for $100!!! Hard to believe a straight key fetches so much coin....anyways....

I have read the thread on smokey radios (along with the scientific explanation of why water does not cause corrosion, I AGREE!!) and have also seen that many people mentioned Deoxit for cleaning...

Both my Dad and step brother smoked around this radio and its smelly, and just from what I can tell by the few hours it has been on, very intermittent with regards to the volume knob. I would be interested to know some major areas to clean, how to clean the volume type pots, controls , etc. I'm fimiliar with radio disassembly to some degree, and have the service and owners manuals for this radio, (many thanks to Al Gore for inventing the internet! LOL). I like the Freebreeze idea with the plastic bag, thats going to be done for sure, along with an entire face/knob removal, but the guts inside have me concerned. Not sure I want to totally disassemble the radio as another fellow has mentioned doing...my 7 year old daughter and my wife will take issue to many nights in the basement...

If anyone has had similiar radio, I would be interested in knowing what major surgurey you did to get it smelling "spring time fresh", hell, I'll even go for the new plastic smell!! But that's pushing it...!!

Many thanks in advance, and Happy Thanksgiving to all...

The V08J rectifiers are still listed as available from East Coast Parts.
You could also use 1N5408. They're rated at 3A, 1000V. Average price per
single unit is about 12 cents each.

Hi,

Congratulations, the TS820S, is the best hybrid radio Kenwood has
produced, better than the 830S acoording to me !
To clean the outside of the radio and the front panel, I do it with
water and detergent. Usual cleaning spray for electronics contact works
fine for the volume pot.
This radio is build like a tank. Sometimes, display is no longer
functionning due to oxidation in the contact strip. Just pull it out and
clean it with contact spray.
Maybe you should also verify the 10 Ohms / 2 watts resistors on the base
of the 6146 tubes. Sometimes they are burn and should than be replaced.
They protect the transfo in case of bad tuning and high swr.

Chris:
The marker signal is on the Mike gain control Turn it fully down until it clicks and the rig will transmit a signal every 25 kHz. Tune the marker at a 100 kHz point on 20, 17. and 15 meters.

Tune in the marker on 21.100. Use USB. Tune for maximum S-meter reading. Tune the drive control for maximum S meter reading.
Now, do the same thing on 18.100.
Now do the same thing on 14.100.
Now do the same thing on 7.100.

Do this with a dummy load attached or no antenna attached. It will probably read highest on 7.100 and weaken slightly as you go up in frequency.

I ma thinking that you do not have a rig problem. The higher H.F. bands have been very dead lately as we are at the sunspot minimum. Background noise is much lower as you go up in frequency. Probably, you have nothing wrong on 17 meters.

Subject: Re: [TS-520_820_530_830] Diode mod on IF board

I am not 100% sure if I have a problem with 17m. On 40 and 20m I always have a noise floor from 4-6 dB. On 17m I have a noise floor of o dab all the time. I hear stations on 17m from 1-6 dab. I have a bigg steppIR Vert. antenna. The SWR is very good on all bands.I have not done the marker signal. I need to read the book to learn how to do this.It would be nice if my 520 had 17m to use as a signal gen. Peaking for a weak signal on 17m with the band going in and out so fast will be fun. I have never adjusted the 18 MHz coils only L-19 and L-20.
thanks..
Chris..

n9wb <n9wb@...> wrote: It should not make any difference what band you are on as it is in the IF.
However, to be sure, on 17 meters, try peaking L-19 for maximum receive on a
weak signal. Then adjust L-20 clockwise past the peak and back CCW to the
peak. Re-peak L-19 until it peaks and then adjust L-20 clockwise past the
peak and then back ccw to the peak.

Repeat the above until no improvement is obtained.

If 17 meters is still weaker, see if peaking the Drive control for maximum
receive brings it to the proper level. If it does, is this different than
the position of the drive control for maximum ALC on CW transmit ?

If readjusting the Drive control does not help, are you sure the receive sensitivity is low or could it be band conditions or your antenna ? How does the marker signal level compare between 20 meters, 17 meters, and 15 meters? Use a 100 kHz point on each band for comparison. Tune in the marker for maximum. Also peak the drive for maximum receive. Use a dummy load when checking this. If a dummy load is not available, disconnect the antenna lead.

Have you ever adjusted the 18 MHz coils on the coil pack board ? If so, they may not be adjusted properly. If you have not adjusted them, I would suggest that you do not until we investigate further.

Way back when we all did the 4 diode and load resistor mod on the IF board.When we had to make the 600mvp-p ajustment on USB and LSB. Did it care what band you were on?

I don't have the same RX on 17m as I do on 40 and 20m band.

The 830 uses 4 20 ohm resistors instead of two 10 ohms like the 820 does. If you measure across any one of them with an ohm meter it should read 5 ohms because all 4 are in parallel. Just because the resistors look good is no assurance. BTW, these are Cathode resistors. They serve as a shunt for the IC meter and serve as a fuse if the finals short.

Hi,

Congratulations, the TS820S, is the best hybrid radio Kenwood has produced, better than the 830S acoording to me !
To clean the outside of the radio and the front panel, I do it with water and detergent. Usual cleaning spray for electronics contact works fine for the volume pot.
This radio is build like a tank. Sometimes, display is no longer functionning due to oxidation in the contact strip. Just pull it out and clean it with contact spray.
Maybe you should also verify the 10 Ohms / 2 watts resistors on the base of the 6146 tubes. Sometimes they are burn and should than be replaced. They protect the transfo in case of bad tuning and high swr.

From: Kevin & Natalia
Topic: 11022 Message: 11074

To Walt and John, and others

Thanks for the information sent so far. I have updated information as requested.

The voltage reading at "SG" on Final board is between 253-257VDC, so this appears to be correct as advised.
The Driver is glowing when the heater is switched on. Can not see the 6146's if they are glowing.
Bias is now back to giving me 60ma, but this is not all the time.
When I switch to tune, and switch to ALC, I am able to get a good swing, and are able to peak the Driver.
When switched to HV, I get no voltage reading, the meter does no swing. I thought I had it swing to around 600v on Tuesday, but not now.

Did notice when looking at the underneath of the radio, looking at the 2 large caps, that one has a burn bubble on it, about 8-10mm diameter, the other appears to that it might have a bit of a leak. I guess these are the filter caps.
The diodes look okay. Got a bit too dark in the shed to check with the meter if they are blown.

Hope this helps with the questions asked from the 2 above persons.

? I notice that the valves in the radio are 6146B's, and I have been given a set of 6146. A bit of reading says it is not best to go back to 6146 if 6146B's are the standard valve used in the radio. I may just get a set (or 2) of 6146W.

Again Thanks for the help and information.

Kevin, ZL1KFM.

Subject: Re: [TS-520_820_530_830] New to Group - No Power Output

Kevin:
I doubt that it is the tubes. With your meter switch on HV what is your high voltage?

It should be in the area of 800 V. If it is low like 400 V you have bad High voltage filter capacitors C-22 and c-24 or a bad diode, D1,D2,D3,D4.

If the high voltage reads correctly, take the cover off of the rig and measure the voltage at the point labeled SG on the bottom of the final board. It should read a bit over 200 VDC.

Use caution around the rectifier board, the capacitors, and the transformer as well as inside of the final unit. There is 800 Volts there.

Does the rig get a normal ALC reading with the meter switch on ALC when tuning up and peaking the drive control ?

Let us know the results from the above.

Subject: [TS-520_820_530_830] New to Group - No Power Output

Hi All,

Thanks to allowing me join this group.

As a owner of a TS-830, I am glad to be able to find this group, and hopefully help with advice, and also receive.

Today, I am in the need of help.

My TS-830, in my care for 5 years, has decided in the past few days to stop transmitting. The last activity was the CQWW contest a few weeks back. The next time I tried using it, I got very little, to no power output. Now I get nothing, bias has even dropped to nothing, well only about 5-10ma, it had been sitting steady on 60ma, as the manual mentions without any problem.

I am guessing the tubes have died, and will need replacing?
I know they are 6146B's, and have checked on eBay and found 6146W's.
What are the differnce between these type? I did hear that the "B" are better?

One comment I received during the contest, was that he could hear a buzz on the TX. Might of been the start of it's death. :(

Any help of any sort would be grateful, wish to get the radio back working, and operating.

Regards
Kevin, ZL1KFM

This is so cool the things you learn each day on this group.
Ok ,,, With the cal on. Looks like my VFO may be off. The marker starts at 7.098.5,14.098.5 and so on. I get 6db on 40,20,17,15 on a dummy load.
You maybe right about my rig. I am new to HF and I have more to learn. But it is fun. More fun than being a reapeater junky.
Have a great Thanksgiving Day to all.
Chris..

n9wb <n9wb@...> wrote: Chris:
The marker signal is on the Mike gain control Turn it fully down until it clicks and the rig will transmit a signal every 25 kHz. Tune the marker at a 100 kHz point on 20, 17. and 15 meters.

Tune in the marker on 21.100. Use USB. Tune for maximum S-meter reading. Tune the drive control for maximum S meter reading.
Now, do the same thing on 18.100.
Now do the same thing on 14.100.
Now do the same thing on 7.100.

Do this with a dummy load attached or no antenna attached. It will probably read highest on 7.100 and weaken slightly as you go up in frequency.

I ma thinking that you do not have a rig problem. The higher H.F. bands have been very dead lately as we are at the sunspot minimum. Background noise is much lower as you go up in frequency. Probably, you have nothing wrong on 17 meters.

I have said it before, but, a Kenwood engineer gave me a good piece of advice, check all the screws holding down the pcbs, especially those that make the ground connections. They work loose in time. Also, if the Instruction Manual is similar to the TS-530, the line up instructions included are more than adequate. The Technical Manual requires a lot of service equipment. Again, if it is the same, or similar as the TS-530, the T2 ??? that it says not to adjust controls the linearity of the S Meter, that does require a high quality calibrated Signal Generator.

Topic: 11069 Message: 11077

Salutations (Charloettes Web), and congratulations on a good start at a station. You've been handed some good choices of gaer for side-band and CW.

I have two 830's myself and the remote VFO 230, with it's 5 digital memories the matching SP 230 speaker and the mc-50 microphone with pc-1 phone patch. That's operational at present. I also have a straight key and a vibroplex along with two TV-506 transverters. I have a linear on a full-size, quarter-wave vertical out in the yard and a MFJ Versa Five tuner. Took me over 25 years to get this far. Your almost half the way there in one shot. You had more than I had when I started. But that's good. Now you got some catching up to do on the bands.
But we both have good gear and members of a good group for resources. I have more winter projects underway. I am working on a complete Kenwood station a piece at a time.

You are starting with a very good radio for your investment in Amteur station. One of the key points of ownership is to keep it clean in the back and it will last. These rigs have a good reputation over the last 30 years. If properly maintained could last 30 more.

As for G5RV, had two of them in the past. Good antenna. Some times they can be a little sharp to tune, but a good tuner gets you around that.

As for cleaning the 830, I recommend looking at the K4EAA website. Ken has some good bits of information there about these radios. Ken sevices and resores these radios on a regular basis. It's a good idea to know your radio inside well. That way when something goes wrong you've already got an idea about whats going on when you work inside.

As for cleaning, I'd recommend a good tuner cleaner. clean the insides with it and I use cottonswabs for tight places with alcohol. keeping the parts clean keeps the circuits from overheating and dying any earlier than it has to. I use fantatic, 409 or windex just for the cabinet tops and bottoms with paper towels for the cigarette residue and other crud. Do this away from the chassis itself. The faceplate comes off too. It's a couple of screws and pull the knobs. clean behind it. You'd be suprised at what gets in there. Watch what you spray around the plastic parts. Some cleaners will harm the surface of the pastic cases of your relay for example.

As a tuner cleaner I use CO Contact Cleaner because it leaves no the residue. Another is the Lectra clean. There are other good cleaners out there and others here in the group may recomend them. We all clean our radios. It pays to become intimate with the inside workings.

As for the Pots and switches. Spray the little slots on the front of the pots. The chemical gets in and you can rotate the wiper around to loosen the dirt. The swiches you can look for an opening to spray into and toggle them to loosen the dirt there too.

Ken has recommended a good lubricant on his website for the chain drives that uses Teflon. Leaves them silky smooth, works well.

As for the mic. don't spray it thru the screen. Maybe spray something you like the smell of on a rag and wipe the surface is about all.

Don't forget a drop of oil to the fan. It's a critical one to it's life.

Sometimes over the years some dirt builds in places where electrical contact is important. moisture in the air. Dirt and other contaminants get in there and cause undesired effects. sometimes the mic howls and this could resolve the issue. Backing off screws and retightening can improve a ground contact. Keeping those band swiches clean can mke a dfifference in reception too. When something doesn't seem logical as to it's cause in these radios, cleaning sometimes finds the answer.

Most of us that have had the 830's don't forget thier performance as we move on to other gear. Some part with them and wish they had it back. I prefer knobs and switches myself to menus and I don't mind tuning up after a change in frequency. My antenna is broad enough to sit in sections of the bands without retuning some controls. I designed them that way.

Enjoy your new found love and see you on the air. 73's.

Hi Dennis and welcome to the group.

The tube shield you speak of on the driver tube 12by7a is not a critical issue. As you can tell the previous operator used it without the shield and it works fine. A shield generally reduces the amount of interaction of other circuits magnetic fields. I use my 830's without the tube shields without a problem. I've talked to others and found the same thing. It originally came with the radio but didn't seem to have much affect upon it's performance.

Dennis <gizmotski@...> wrote:
Hello to the group. Just joined within the last two weeks, and have
been lurking and learning. Recently aquired a TS-520s, and TS-820s
both in excellent condition.(I am currently bunking in with the dog).
On the 820s the black tube sheild is missing from 12By7A tube. The
ground strap is still there. How important is the metal sheild on the
tube? I think I read somewhere on the some other radios they were
removed because of heat, but not sure. If it is a must I would think
it could be found or even made. Thanks and hello

Topic: 11050 Message: 11079

OK well make sure you keep the contacts clean too. They'll make a difference in reception. Good luck with the 830M. I have 830S, good radios. We just recomend a good clean first as it often eliminates problems. I've even burnished a relay to solve a problem.

Giuseppe Bisesti <i8vye@...> wrote: Hi everybody,

i experienced a trouble i didn't yet find on the net. I post the solution i found for sake of experience sharing.

The ts830m is an european version of the rig whith am capability instead of narrow cw capability.

The symptom was audio very weak on SSB/CW rx but good sensitivity (smeter showed the right indications on cal position). On tx the monitor audio level was really ok. The audio level was also good on am rx.

A quick look at the schematics showed that in the rx section there is an additional board for am detection. The board is readily accessible simply removing the top rig cover.

During the ssb and cw reception that board is bypassed by a dpdt dil relay, while the signal coming from monitor detection circuitry is directly fed to the audio amp just after the am board.

So, the solution is very simple: substitute the relay. It's a commonly avalaible and cheap relay. So no reason, for me, to try to clean it. Simply substituted.

Hope all above of some interest for someone.

As for the coupler, order that from Kens K4EAA website. They're brass instead of the ones you see in the radio but work well and will outlast the originals if installed correctly. There's no need to worry about interaction or shock with the couplers and the knob on the end. make sure you align the shaft correctly. See if the inductor will hold up for now. You might watch the heat you generate in the PA. Tuning correctly may help at this point by minimizing the stress on the parts; good airflow too.

Replace your tubes and neutralize. See what you get. Now you see why you look at the PA box and interior of the radio regularly.

rodgerbryce <gm3job@...> wrote:
Thanks to N9WB & KA3DPW for their input on my problems, based on
their advice and a more detailed examination, I have found the
following:

1. Resistors 2,3,4 & 5 appear to be alright visually, no signs of
any damage.

2.The bandswitch located within the PA compartment is not moving,
the inoming shaft is turning at the flexible coupler. I do not have
an allen key of the right size as yet to try and tighten the set
screws.(not surprising I blew a valve!)
Assuming I can tighten the existing or have to replace the coupler
how do I go about setting it all back up again??

3.At the bottom of the final choke within the PA compartment, there
is a 0.01uF capacitor which goes to ground and what appears to be
choke which goes to the 800v connection on the bottom side.I think
it is L1 a 6.8uh choke, it has been severely overheating judging by
the colour of it, green at the ends black in the middle, does anyone
know what sort of resistance value I should get through this??

Thanks in advance for any information.

Hey Dave,

Welcome to the group. I recently acquired an 830 after a long time without one. I think I had one back in 1991 or so, shortly after I got my ticket. When I tell people I traded my TS850S for the 830 with matching SP230 speaker and AT230 tuner, they tell me I am crazy. But listening to the 830 it sounds every bit as good as the 850 did. I have since picked up the matching digital VFO-230. I don't mind tuning up, it only takes about 10 seconds and the transmit audio with my electret mic element is great.

First thing I do whenever I get a new piece of gear into the shack is remove the knobs, front panel and covers and give everything a thorough cleaning with mild dish soap. I soak the knobs for an hour or so to remove stains. By the time it goes back together it's looking new. It's fun and you learn a little bit about the gear at the same time and makes it a pleasure to show off in the shack.

Hope to hear you on the air sometime. Check out the KenwoodQSO group as well.

If the meter is displaying 60ma of idle PA IP bias current in SSB transmit mode then the final tube filaments are ok plus there is high voltage on the final tube plates. Without high voltage on the plates, the tube will not conduct and there will be no 60ma of PA idle bias showing on the meter in the IP position. To be sure, you can check the HV on the HV power supply board as well as at the final tube plate caps. Remember, there is high voltage inside the radio that can be lethal and can kill you! SAFETY FIRST!!!

If the meter is displaying signal strength in receive but no HV in transmit, more than likely there is a problem in the HV meter switch position. The meter will only show HV when in transmit.

As for the capacitors showing a "bubble" and "leakage", there's no question, replace them. Diodes normally do not show any visual evidence of failure unless the voltage rating has been exceeded and they crack, brake apart or explode. Otherwise, checking them with an ohm meter is the only way to tell.

You should not be seeing ALC on the meter in "TUNE" or CW mode. In "TUNE" mode, the high voltage to the final amplifier tubes is reduced and there is no ALC voltage applied to the final amplifier tubes. In CW mode, the front panel CARRIER control controls the RF amplifier gain, not the ALC voltage. Normal sideband ALC indication will cause the meter to swing between 25 and 75% of the ALC meter scale, all based on the mic gain setting and how loud you are talking into the microphone and if the processor is turned on and the level at which it's set. Any ALC meter reading that exceeds the ALC meter scale is an indication of overmodulation which causes the final amplifier to no longer be linear producing splatter to adjacent frequencies.

For further information on the use of 6146 tubes use the following link

http://k9sth.com/Page_2.html

This link will provide you with a wealth of information about the 6146 final tubes.

11084. VFO 230 PROBLEM!

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-24 10:07:02 UTC
From: m3snd
Topic: 11084 Message: 11084

Hi group i have connected up my 830 line up after a year in dry storage,and after a couple of days the vfo230 isnt playing ball.
It is connected with the supplied din cable which i have continuity checked to be ok
It powered up with the 830 but after a couple of days it started to give odd read outs on the digital display and on some frequencies it would jump 10Khz on tuning the vfo.
I fired it up today and there's no read out at all,regardless if its in vfo or main on the function section.
Its not properly in control of the 830 anymore,only the display on the 830 dissapears when i switch the vfo to vfo/rx and vfo/tx.
Disconected from the line up the 830 works perfectly as normal.
So a bit long winded i dont think ive left anything out so i ask my fellow enthusiasts if they have encountered any of these problems or know of any solutions.
Any constructive comments would be gratefully received.

From: n9wb
Topic: 10950 Message: 11085

Point K:

The individual final board schematic shows two connections. They lead to the tube cathodes. the tube cathodes are in parallel so both K terminals are in parallel.
On the main schematic, these K points are not shown. I do not have a TS-820 to disassemble at this time, mine is at another location, but I suspect that these terminals do not exist on the actual board. This board may have been designed to use in other rigs as well, or used in an AM European version of some kind that was intended to have AM and was never marketed.

In the next couple of weeks I will have my 820 apart and will check for connections to these K points. If there are connections, I need to document where they go.

To check the cathode circuit, measure across R2 or R3 with an ohm meter while in the circuit, rig off of course. Since these are in parallel, the combined value should read 5 ohms.

If I remember, you had R2 and R3 short, but tested the finals in a 520 and they worked OK. Another problem that can cause this is If you lost control grid bias.

When you get things back together, build a light bulb tester. Fire up the rig with the filaments off. Turn it on and observe the light bulb. In normal operation, the light bulb will get very bright for an instant when the filaments are turned on and then dim back down as they warm up. If the tube starts drawing excessive current, the light bulb will get bright. Turn the rig off.

If the above checks out OK, key the rig on SSB with the mike gain down and observe the meter in IP. See if you can get 60 ma idle bias.

Let us know what you find from the above.

Steve,
I have studied the Schematic and I don't believe there is a K at all in the Schematic. I don't know why it shows on the Diagram . In fact, I find NO other K at all.

Perhaps Walt can help us out here. I don't have an 820 here in front
of me to check out.

Gordon

Subject: Re: [TS-520_820_530_830] Diode mod on IF board

This is so cool the things you learn each day on this group.
Ok ,,, With the cal on. Looks like my VFO may be off. The marker starts at 7.098.5,14.098.5 and so on. I get 6db on 40,20,17,15 on a dummy load.
You maybe right about my rig. I am new to HF and I have more to learn. But it is fun. More fun than being a reapeater junky.
Have a great Thanksgiving Day to all.
Chris..

n9wb <n9wb@...> wrote: Chris:
The marker signal is on the Mike gain control Turn it fully down until it clicks and the rig will transmit a signal every 25 kHz. Tune the marker at a 100 kHz point on 20, 17. and 15 meters.

Tune in the marker on 21.100. Use USB. Tune for maximum S-meter reading. Tune the drive control for maximum S meter reading.
Now, do the same thing on 18.100.
Now do the same thing on 14.100.
Now do the same thing on 7.100.

Do this with a dummy load attached or no antenna attached. It will probably read highest on 7.100 and weaken slightly as you go up in frequency.

I ma thinking that you do not have a rig problem. The higher H.F. bands have been very dead lately as we are at the sunspot minimum. Background noise is much lower as you go up in frequency. Probably, you have nothing wrong on 17 meters.

Subject: Re: [TS-520_820_530_830] Diode mod on IF board

I am not 100% sure if I have a problem with 17m. On 40 and 20m I always have a noise floor from 4-6 dB. On 17m I have a noise floor of o dab all the time. I hear stations on 17m from 1-6 dab. I have a bigg steppIR Vert. antenna. The SWR is very good on all bands.I have not done the marker signal. I need to read the book to learn how to do this.It would be nice if my 520 had 17m to use as a signal gen. Peaking for a weak signal on 17m with the band going in and out so fast will be fun. I have never adjusted the 18 MHz coils only L-19 and L-20.

thanks..
Chris..

n9wb <n9wb@...> wrote: It should not make any difference what band you are on as it is in the IF.
However, to be sure, on 17 meters, try peaking L-19 for maximum receive on a weak signal. Then adjust L-20 clockwise past the peak and back CCW to the peak. Re-peak L-19 until it peaks and then adjust L-20 clockwise past the peak and then back ccw to the peak.

Repeat the above until no improvement is obtained.

If 17 meters is still weaker, see if peaking the Drive control for maximum receive brings it to the proper level. If it does, is this different than the position of the drive control for maximum ALC on CW transmit ?

If readjusting the Drive control does not help, are you sure the receive sensitivity is low or could it be band conditions or your antenna ? How does the marker signal level compare between 20 meters, 17 meters, and 15 meters? Use a 100 kHz point on each band for comparison. Tune in the marker for maximum. Also peak the drive for maximum receive. Use a dummy load when checking this. If a dummy load is not available, disconnect the antenna lead.

Have you ever adjusted the 18 MHz coils on the coil pack board ? If so, they may not be adjusted properly. If you have not adjusted them, I would suggest that you do not until we investigate further.

Way back when we all did the 4 diode and load resistor mod on the IF board.When we had to make the 600mvp-p ajustment on USB and LSB. Did it care what band you were on?

I don't have the same RX on 17m as I do on 40 and 20m band.

11087. Re: [TS-520_820_530_830] Re: New to Group - No Power Output

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-24 11:18:42 UTC
From: n9wb
Topic: 11022 Message: 11087

I would like to clarify something.
The screen voltage, not the plate voltage to the final tube is reduced in the tune mode. The ALC will read on CW and tune. The carrier control controls the drive to the finals and the ALC is derived from there. For CW operation, After tuning up with the carrier control fully up, reduce it until the power just starts to drop. Now the ALC will read 0 or very low. If you are operating SSB, just leave the carrier control fully up as it does not affect SSB and it will be ready for the next tune up.
Please put the model of rig in the subject line. It makes this thread easier to follow.

Subject: [TS-520_820_530_830] Re: New to Group - No Power Output

If the meter is displaying 60ma of idle PA IP bias current in SSB transmit mode then the final tube filaments are ok plus there is high voltage on the final tube plates. Without high voltage on the plates, the tube will not conduct and there will be no 60ma of PA idle bias showing on the meter in the IP position. To be sure, you can check the HV on the HV power supply board as well as at the final tube plate caps. Remember, there is high voltage inside the radio that can be lethal and can kill you! SAFETY FIRST!!!

If the meter is displaying signal strength in receive but no HV in transmit, more than likely there is a problem in the HV meter switch position. The meter will only show HV when in transmit.

As for the capacitors showing a "bubble" and "leakage", there's no question, replace them. Diodes normally do not show any visual evidence of failure unless the voltage rating has been exceeded and they crack, brake apart or explode. Otherwise, checking them with an ohm meter is the only way to tell.

You should not be seeing ALC on the meter in "TUNE" or CW mode.
In "TUNE" mode, the high voltage to the final amplifier tubes is reduced and there is no ALC voltage applied to the final amplifier tubes. In CW mode, the front panel CARRIER control controls the RF amplifier gain, not the ALC voltage. Normal sideband ALC indication will cause the meter to swing between 25 and 75% of the ALC meter scale, all based on the mic gain setting and how loud you are talking into the microphone and if the processor is turned on and the level at which it's set. Any ALC meter reading that exceeds the ALC meter scale is an indication of overmodulation which causes the final

amplifier to no longer be linear producing splatter to adjacent frequencies.

For further information on the use of 6146 tubes use the following link

http://k9sth.com/Page_2.html

This link will provide you with a wealth of information about the 6146 final tubes.

This is so cool the things you learn each day on this group.
Ok ,,, With the cal on. Looks like my VFO may be off. The marker starts at 7.098.5,14.098.5 and so on. I get 6db on 40,20,17,15 on a dummy load.
You maybe right about my rig. I am new to HF and I have more to learn. But it is fun. More fun than being a reapeater junky.
Have a great Thanksgiving Day to all.
Chris..

n9wb <n9wb@...> wrote: Chris:
The marker signal is on the Mike gain control Turn it fully down until it clicks and the rig will transmit a signal every 25 kHz. Tune the marker at a 100 kHz point on 20, 17. and 15 meters.

Tune in the marker on 21.100. Use USB. Tune for maximum S-meter reading. Tune the drive control for maximum S meter reading.
Now, do the same thing on 18.100.
Now do the same thing on 14.100.
Now do the same thing on 7.100.

Do this with a dummy load attached or no antenna attached. It will probably read highest on 7.100 and weaken slightly as you go up in frequency.

I ma thinking that you do not have a rig problem. The higher H.F. bands have been very dead lately as we are at the sunspot minimum. Background noise is much lower as you go up in frequency. Probably, you have nothing wrong on 17 meters.

11091. Re: [TS-520_820_530_830] VFO 230 PROBLEM!

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-24 16:11:40 UTC
From: John Harp
Topic: 11084 Message: 11091

Kevin,

I hav ean 830 with the VFO like you. Mine does similar things. usually a reset is all it takes to clear mine. So try this.

First, make sure the VFO connector is plugged in correctly. Sometimes mine gets a little loose form moving around behind my gear for adjustments or adding something.

Second, make sure the buttons are set for main. This will allow the 830 to operate from it's own VFO and not the 5 memories or the remote tuner. Set it for main.

Third, leave the TS-830 powered up, but unplug the power cord to the wall. Power to the radio and no power to the VFO. This is the reset I spoke of. Leave it down momentarily. Then plug it back in and see how it responds. It should reset itself at this point.

At this point after the reset, you should be able to see it work on the 830 and the 830 can set its own frequency. If this is so, the buttons VFO should now be able to change to remote. When this is done you should be able to see the display on both show the same frequency. After that check as your manual instructs on how to store a frequency and bring it back.

You have 5 memories. As long as power is to the unit you will retain those stored frequencies. Power is lost for any kind of a period of time, even milliseconds the stored are gone. It's volatile RAM is what this is. That's how the remote should operate.

Go try it and see how it works and get back to me with the results.

Subject: [TS-520_820_530_830] Diode mod on IF board

Way back when we all did the 4 diode and load resistor mod on the IF board.When we had to make the 600mvp-p ajustment on USB and LSB. Did

it care what band you were on?

I don't have the same RX on 17m as I do on 40 and 20m band.
Chris..

11093. TS-520SE Rehabilitation

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-24 16:32:42 UTC
From: baumbrent
Topic: 11093 Message: 11093

I have just finished replacing the 10 meter crystals in my 520SE.
However, digging around inside my rig has left me with a few questions.

First, do I need to retune the coils for the 10 meter band (I undid an
11 meter mod)?

Second, whoever did the 11 meter mod did a real kludge of a job when
soldering in the 11 meter crystals - he burned the pads off the pc
board! Will bridging from the original pad location to the next solid
pad in the trace create a significant capacitance between the lead
from the crystal and the remaining trace?

Third, I noticed that the air variable capacitors on the drive control
don't seem to line up. When the center capacitor is all the way open
the other two still have a few degrees of rotation left in them. Is
this normal or should all three hit the stop at the same time?

The two biggest surprises in doing this work (besides the burned board)
were the huge spider's nest back by the power supply, and discovering
after the fact that I didn't have to disassemble the whole front
chassis to get the oscillator board out (there's actually little holes
for the rods to slide through). Oh well, the rig just got a more
through cleaning than it might have otherwise.

Thanks and 73,
K7MEI, Brent

This is so cool the things you learn each day on this group.
Ok ,,, With the cal on. Looks like my VFO may be off. The marker starts at 7.098.5,14.098.5 and so on. I get 6db on 40,20,17,15 on a dummy load.
You maybe right about my rig. I am new to HF and I have more to learn. But it is fun. More fun than being a reapeater junky.
Have a great Thanksgiving Day to all.
Chris..

n9wb <n9wb@...> wrote: Chris:
The marker signal is on the Mike gain control Turn it fully down until it clicks and the rig will transmit a signal every 25 kHz. Tune the marker at a 100 kHz point on 20, 17. and 15 meters.

Tune in the marker on 21.100. Use USB. Tune for maximum S-meter reading. Tune the drive control for maximum S meter reading.
Now, do the same thing on 18.100.
Now do the same thing on 14.100.
Now do the same thing on 7.100.

Do this with a dummy load attached or no antenna attached. It will probably read highest on 7.100 and weaken slightly as you go up in frequency.

I ma thinking that you do not have a rig problem. The higher H.F. bands have been very dead lately as we are at the sunspot minimum. Background noise is much lower as you go up in frequency. Probably, you have nothing wrong on 17 meters.

Subject: Re: [TS-520_820_530_830] Diode mod on IF board

I am not 100% sure if I have a problem with 17m. On 40 and 20m I always have a noise floor from 4-6 dB. On 17m I have a noise floor of o dab all the time. I hear stations on 17m from 1-6 dab. I have a bigg steppIR Vert. antenna. The SWR is very good on all bands.I have not done the marker signal. I need to read the book to learn how to do this.It would be nice if my 520 had 17m to use as a signal gen. Peaking for a weak signal on 17m with the band going in and out so fast will be fun. I have never adjusted the 18 MHz coils only L-19 and L-20. thanks..
Chris..

n9wb <n9wb@...> wrote: It should not make any difference what band you are on as it is in the IF.
However, to be sure, on 17 meters, try peaking L-19 for maximum receive on a weak signal. Then adjust L-20 clockwise past the peak and back CCW to the peak. Re-peak L-19 until it peaks and then adjust L-20 clockwise past the peak and then back ccw to the peak.

Repeat the above until no improvement is obtained.

If 17 meters is still weaker, see if peaking the Drive control for maximum receive brings it to the proper level. If it does, is this different than the position of the drive control for maximum ALC on CW transmit ?

If readjusting the Drive control does not help, are you sure the receive sensitivity is low or could it be band conditions or your antenna ? How does the marker signal level compare between 20 meters, 17 meters, and 15 meters? Use a 100 kHz point on each band for comparison. Tune in the marker for maximum. Also peak the drive for maximum receive. Use a dummy load when checking this. If a dummy load is not available, disconnect the antenna lead.

Have you ever adjusted the 18 MHz coils on the coil pack board ? If so, they may not be adjusted properly. If you have not adjusted them, I would suggest that you do not until we investigate further.

The 'apparent' frequency of the Cal marker depends on which mode you look at it on.

The 520 has 3 'markers' for frequency on its dial dependant on mode.

Appreciated Chris.

So does the Cal minimise out at 18.098.5 on one sideband 18.105.5 on
the other and 18.100 excatly on CW

If so - then you have no problem.

Doubtless a bigger eggspert will be along on a minite

Yes I remember I was confused by that very same thing when I first got mine. That's why I elaborated a little. So you would better understand the machine function.

I keep memories loaded with 5 spots to monitor a band quickly by jumping from frequency to another. Come in handy for split transieve too. Enjoy and see you on the air.

Yes I remember those days. Dreamin of bein a ham. Ham Radio Club in high school. Got my liscence by mail exam for novice then. WB3KLE administered the test then. On the air CW Live was how I got my code. 5 imutes perfect copy as I remember it. Best way to test, do the real thing.

Within one year I bought my first HF transciever It was my TS-830. The first one bought it when the company I worked for bought my vacation back from me. That was a tough year.

Ran that rtadio for almost 30 years and bought a second one. Luv'em. Don't wanna part with'em either. Got many matching accessories too. Even VHF.Enjoy, I've wondered what it'd be like to have one pool side. someday maybe. Later 73's.

Subject: Re: [TS-520_820_530_830] Diode mod on IF board

This is so cool the things you learn each day on this group.
Ok ,,, With the cal on. Looks like my VFO may be off. The marker starts at 7.098.5,14.098.5 and so on. I get 6db on 40,20,17,15 on a dummy load.
You maybe right about my rig. I am new to HF and I have more to learn. But it is fun. More fun than being a reapeater junky.
Have a great Thanksgiving Day to all.
Chris..

n9wb <n9wb@...> wrote: Chris:
The marker signal is on the Mike gain control Turn it fully down until it clicks and the rig will transmit a signal every 25 kHz. Tune the marker at a 100 kHz point on 20, 17. and 15 meters.

Tune in the marker on 21.100. Use USB. Tune for maximum S-meter reading. Tune the drive control for maximum S meter reading.
Now, do the same thing on 18.100.
Now do the same thing on 14.100.
Now do the same thing on 7.100.

Do this with a dummy load attached or no antenna attached. It will probably read highest on 7.100 and weaken slightly as you go up in frequency.

I ma thinking that you do not have a rig problem. The higher H.F. bands have been very dead lately as we are at the sunspot minimum. Background noise is much lower as you go up in frequency. Probably, you have nothing wrong on 17 meters.

Subject: Re: [TS-520_820_530_830] Diode mod on IF board

I am not 100% sure if I have a problem with 17m. On 40 and 20m I always have a noise floor from 4-6 dB. On 17m I have a noise floor of o dab all the time. I hear stations on 17m from 1-6 dab. I have a bigg steppIR Vert. antenna. The SWR is very good on all bands.I have not done the marker signal. I need to read the book to learn how to do this.It would be nice if my 520 had 17m to use as a signal gen. Peaking for a weak signal on 17m with the band going in and out so fast will be fun. I have never adjusted the 18 MHz coils only L-19 and L-20. thanks..
Chris..

n9wb <n9wb@...> wrote: It should not make any difference what band you are on as it is in the IF.
However, to be sure, on 17 meters, try peaking L-19 for maximum receive on a weak signal. Then adjust L-20 clockwise past the peak and back CCW to the peak. Re-peak L-19 until it peaks and then adjust L-20 clockwise past the peak and then back ccw to the peak.

Repeat the above until no improvement is obtained.

If 17 meters is still weaker, see if peaking the Drive control for maximum receive brings it to the proper level. If it does, is this different than the position of the drive control for maximum ALC on CW transmit ?

If readjusting the Drive control does not help, are you sure the receive sensitivity is low or could it be band conditions or your antenna ? How does the marker signal level compare between 20 meters, 17 meters, and 15 meters? Use a 100 kHz point on each band for comparison. Tune in the marker for maximum. Also peak the drive for maximum receive. Use a dummy load when checking this. If a dummy load is not available, disconnect the antenna lead.

Have you ever adjusted the 18 MHz coils on the coil pack board ? If so, they may not be adjusted properly. If you have not adjusted them, I would suggest that you do not until we investigate further.

Way back when we all did the 4 diode and load resistor mod on the IF board.When we had to make the 600mvp-p ajustment on USB and LSB. Did it care what band you were on?

I don't have the same RX on 17m as I do on 40 and 20m band.

Brent,

I don't know if you need to readjust the 10 meter coils but I'd say probably not. No way to tell for sure until you turn on the radio. If the mod were known to have a re-tune then that would probably answer the question. If they didn't retune it then you shouldn't have to either.

Alot of the CB people have little or no technical expertise. Not suprising about the pads and traces. To much heat. Lifts foils and burns them. Probably ok to use the substitution you've described. But again only one way to tell, when it turns on.

Take it on the air and see how it performs. listen in. then load it into a dummy load and see how it does. then call and find a signal report.

As for the caps. probably not a problem.

baumbrent <brentbaum5323@...> wrote:
I have just finished replacing the 10 meter crystals in my 520SE.
However, digging around inside my rig has left me with a few questions.

First, do I need to retune the coils for the 10 meter band (I undid an
11 meter mod)?

Second, whoever did the 11 meter mod did a real kludge of a job when
soldering in the 11 meter crystals - he burned the pads off the pc
board! Will bridging from the original pad location to the next solid
pad in the trace create a significant capacitance between the lead
from the crystal and the remaining trace?

Third, I noticed that the air variable capacitors on the drive control
don't seem to line up. When the center capacitor is all the way open
the other two still have a few degrees of rotation left in them. Is
this normal or should all three hit the stop at the same time?

The two biggest surprises in doing this work (besides the burned board)
were the huge spider's nest back by the power supply, and discovering
after the fact that I didn't have to disassemble the whole front
chassis to get the oscillator board out (there's actually little holes
for the rods to slide through). Oh well, the rig just got a more
through cleaning than it might have otherwise.

Thanks and 73,
K7MEI, Brent

Appreciated Chris.

So does the Cal minimise out at 18.098.5 on one sideband 18.105.5 on
the other and 18.100 excatly on CW

If so - then you have no problem.

Topic: 11024 Message: 11105

Hi Chris,

Are those freqs you listed for max signal strength on your marker signal? My 830S shows about S8.5 at those you listed. To check your VFO calibration you are looking for zero beat not max or minimum meter reading. If you check at 18.100 you should be zero beat with the S meter at about S3 .... Turn your VFO just past 18.099.9 and zero beat should occur as soon as your display turns to 18.100.00 If your carrier oscillators are set up correctly you should be able to switch back and forth between USB/LSB and be zero beat on either sideband without touching your VFO.
Find an AM station on 40 meters tonight. There is a BBC broadcast at 7.160 that is usually very strong here after dark for instance. The AM station should sound exactly the same on either sideband if they are set up correctly.

11106. No ALC in TS-520

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-24 22:05:16 UTC
From: Karl Schwab
Topic: 11106 Message: 11106

Gentlemen; Last week, I decided to pull the old '520 off of the shelf where it has been setting for about 10 years and put it on the air. At first, I had no ALC, but in moving the "SG" slide switch on the rear panel, my ALC returned and the rig was on the air working DX and getting great reports. Later in the week I again fired up the rig, and again, no ALC. This time wiggling and moving the SG switch did nothing. Years ago, I had this same problem, but it was rare, and the ALC always returned with a wiggling of the SG switch. But, not this time.

I checked the SG switch with my Ohm meter, even jumpered it, still nothing. I removed the relay from its socket under the VOX board, checked its contacts for continuity with my Ohm meter while working its armature manually and all was well there. I did not know if the relay was part of the ALC circuit, but it being a mechanical component, I thought that I would give it a try.

I do not have a service manual, only the owners manual and now I am stuck and I hope that this Group can help me out. Any ideas fellas? 73, de KO8S, Karl

It will have to be retuned and you can't just do 10m. On the 520S & SE
160 is tuned first then 10m, 15m, 20m, 40m, 80m. If you don't do them
in order it won't work right.

The extra capacitance won't hurt anything, just get it all hooked up
correctly and adjust the Osc coils. I've had to go straight to the
switch contacts before due to Chicken Charlie mods.

The three variables need to bee in the same position. Do this before
aligning it or you get to align it again.

On alignment I use the marker for the Rx side and peak the s-meter and
turn off the SG switch and read ALC for the Tx side. Make sure there
is a 50 ohm dummy load attached to the ant connection or it will throw
off the alignment.

You actually need a scope to set the oscillators, max level and then back out 1/4 turn.

Clif

11109. Checking frequency Calibration on TS-830

Checking frequency Calibration on TS-830

Marker off.
VBT Fully clockwise. (Normal)
IF shift center.
Notch Off
RIT off
USB
Go to 10.000 MHz. at a time when you can hear WWV. Tune the rig for max receive of WWV. Now carefully listen and tune WWV switching between USB then LSB until you are at the point where WWV sounds as much the same as possible on USB and LSB. The digital readout should read 10.0000.

Greetings group, long time no chat!

Re: TS-520

I've notice that my dial lights dim and brighten, while losing and gaining (respectively)about five watts, according to the power meter.

This happens only during transmit or tuning.

Nothings changed that I know of and I've re-tuned it to verify all settings are correct. Still puts out over 100w nicely, but I thought I'd ask before something got worse. I haven't found anything regarding this, but there's a lot of messages to sort through. If you know of a previous thread, please advise.

Any ideas?

Frank, K2NCC

11114. TS-520s VFO

I just found this group today and think it is great.

I am using a TS-520s at our local EOC, and it works well with one exception. The VFO spinner knob seems very loose to me. Is there an adjustment to apply more friction to the mechanism? I haven't located one yet. also when the rig is set to a partiicular frequency, if the VFO knob is moved in any way, the frequency shifts. It appears there may be wear in the bushing on the VFO.

Any suggestions?

73,
Jimmy, W9JDH

For sale ads:

The opening statement on the home page states "Please do not post for sale ads here". We do allow posts by individuals who have an occasional rig for sale on the "KenwoodQSO" group.

Now might be a good time to ask, how the group members feel about this?
Should we keep the policy as is, "No for sale posts." or should we allow occasional posts by individuals who have gear directly to Kenwood Hybrids, with the restriction that interested buyers contact the buyer directly, not on the forum.

Personally, I think it would be fine. I wouldn't be bothered by it. Much better to do what hams do, horse-trade, than to give eBay the money. Maybe allowing only ham-related items would be ideal. Keeping to the same guidelines as found on-the-air.

The flip-side to that argument is that there are plenty of free places to put your item up for sale.

Maybe a good balance would be that items posted for sale must be Kenwood hybrid 520/820/530/830 related? If it isn't one or doesn't work with one, don't post it.

That would keep to the theme and limit the amount of for-sales in the forum.

Maybe do a Yahoo group Poll.

You probably would have to define "occasional posts". Interpretation left
to the reader can be widely varied.

Good points, but I think I found it. The one thing that did change is that I put a space-heater on the same surge-protector that the radio is on. It's been stable since removing the heater from the line, but I'll keep an eye on it and inquire again if changing things doesn't help. Just wanted to make sure that I got the problem before smoke came out of the radio! 8)

Meanwhile, in a slightly unrelated question, if the antenna gives me a 5:1 SWR in the Through position (of the AT-230 tuner) but can tune fine (1:1) in the Matching, am I losing power to the antenna when using the tuner? The antenna tunes nicely w/the tuner, but I'm under the impression that SWR isn't the end-all. Efficiency is lost if the antenna must be tuned that much, right?

Frank, Which antenna is it and on which band? When you have SWR on the coax, coax losses increase. That is where the loss comes from. At 5:1 the loss would not be way high but higher than say 3:1.

I'd say that the heater is your culprit.

40 meter. 20 meter is even worse. But all bands will tune to less
than 2:1. Just seems like something isn't right, in spite of being
tunable. The maker of the Cobra says it requires a tuner, which I can
understand for a multiband antenna, and in some cases (like 60m) it's
a very nice 1:1 w/o the tuner. I'm about to move the antenna about 10
feet up (painting the house) and I'll do a SWR curve to check it
across the bands then. I think it was a great replacement to my
four-legged dipole tuned to 20/40, but seemed to have sacrificed
efficiency, if I understand correctly.

>... When you have SWR on the coax

If it makes a difference, it's a 450 ladder line w/a 4-1 balun. From
what I understand, that should be a low-loss choice.

Walt
Personally I would like to be able to have an opportunity to purchase equipment from a Kenwood lover rather than Fleabay. If you recall I came into my TS-510 thru an ad on this forum. I made a new Ham friend only 20 miles away and inherited his project that he was unable to complete. I got a radio I could not afford to buy and he got to know his project would be completed and not sent to the landfill.
I would think a maximum one listing per month would suffice to allow individuals to pass on their unwanted or unused equipment.
regards
Barry

I might be a bit unclear on what the difference between initial loss and multiplied loss is though.

> Should be a good system.

That's good to hear. Wish I could get the ends up higher tho'. Apex of the antenna will be at about 25' but the inverted-V ends of the Cobra will only be at five feet. I'm thinking about laying that inverted-V on it's side by angling it across the roof. Or, at least, one of the legs across the roof (off the roof surface, of course) and the other leg staying at it's fence-high level.

Personally I see no harm in carrying both For Sale and Wanted Ads, as
long as they are purely for or related to, the specified equipment and
do not run into the realms of 'stock lists'.

I certainly agree that any responses should be offlist.

We do need to keep these rigs both 'running' and in the hands of those
who care.

Why not give it a month or so's trial ?

11130. Re: [TS-520_820_530_830] Re: am I losing power/efficiency to the antenna when...

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-26 12:46:13 UTC
From: n9wb
Topic: 11122 Message: 11130

Antenna feedline has a loss figure per 100 ft. This is calculated when terminated at it's characteristic impedance, with RG-8U that is around a pure resistance value of 50 ohms. with 450 ohm line this is around a pure resistance of 450 ohms.

The loss of balanced line is very much lower than that of coax. However, the loss in good coax is so low that it is not important when terminated with an impedance near 50 ohms. This will produce close to a 1:1 SWR.

When the SWR increases significantly on a coaxial line, the losses multiply by a number increasing as the SWR increases. So, for example, if you feed an 80 meter dipole on 40 meters using a tuner, the SWR will be in excess of 10:1. The tuner will transform the values that will be unfriendly to your rig to a nice 50 ohms non-reactive value that the transmitter will be happy with. But as the signal travels up the coax much of it will be lost as heat. What remaining 40 meter power reaches the 80 meter dipole will be radiated very efficiently, but the power available at this point will be reduced significantly depending on the length of the coax.

When the SWR increases on a balanced line such as 450 ohm ladder line, the losses also multiply by a number increasing as the SWR increases. But the loss of balanced line that is terminated by a pure resistance of it's characteristic resistance is much lower that of coax.

Even though the loss of coax is significantly higher than balanced line, the loss is negligible when terminated with a complex impedance near it's characteristic impedance. (low SWR)

The loss of balanced line is greatly lower than coax. While this difference is insignificant at low SWR, the difference becomes greatly significant when the SWR is high. A small number multiplied by a small number is far less than a larger number multiplied by a number of equal or greater amount.

So even with a high SWR, balanced line provides a relatively low loss path from the tuner/balun to the antenna feed point. On the other hand, with a high SWR coax provides a terrible loss path from the tuner to the antenna feed point if it is very long. (15 ft or more).

So the initial loss for a given line is that loss when it is terminated in a complex impedance near it's characteristic impedance. (low SWR)
The multiplied loss it the actual loss when terminated with a complex impedance removed from it's characteristic impedance. (high SWR)

So the loss of a length of good balanced line to a mismatch will be so low that it is negligible compared to that of a coax feeding the same mismatch.

It is not important that a simple antenna be resonant from an efficiency standpoint except for line loss.

One contradiction to this is that as an antenna becomes shorter than 1/4 wave on each side of the feedline, efficiency decreases slightly until it reaches 1/8 wave on each side of the feedline. Then the losses increase rapidly due to lowered radiation resistance that approaches the ohmic value of the radiating hardware. But that is a totally different topic. The bottom line is that a 40 meter dipole fed with balanced line will have about 1/2 S unit loss on 80 meters.

This Cobra antenna that you have chosen does not present a perfect match on all bands, but compared to other balanced line fed dipoles, provides a relatively lower mismatch lowering the losses of the balanced line a bit more. 5 to 1 is a lot better than 20 to 1.

The G5RV does the same thing except that it requires a coax section. This has always bothered me with this design because on some bands there will be notable loss in the coax section.

The disadvantage of this antenna compared to a parallel resonant dipole is that you must adjust the tuner when changing bands. This problem aside, it will be a good antenna. It will be even better when you elevate the feedpoint.

Subject: [TS-520_820_530_830] Re: Are "for sale" ads allowed?

Personally, I think it would be fine. I wouldn't be bothered by it.
Much better to do what hams do, horse-trade, than to give eBay the
money. Maybe allowing only ham-related items would be ideal. Keeping
to the same guidelines as found on-the-air.

The flip-side to that argument is that there are plenty of free places
to put your item up for sale.

Maybe a good balance would be that items posted for sale must be
Kenwood hybrid 520/820/530/830 related? If it isn't one or doesn't
work with one, don't post it.

That would keep to the theme and limit the amount of for-sales in the
forum.

Maybe do a Yahoo group Poll.

Frank, K2NCC

11139. TS-820S Final Tubes replacement?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-26 15:53:34 UTC
From: cprocny
Topic: 11139 Message: 11139

Hello to All
I'm new in this group, recently upgraded to General and purchased a TS-820S XCVR which works fine but it puts out ~100W in CW. I wonder if this is an indication that I should start thinking on replace the final tubes. The manual calls for S2001 tubes which I think are obsolete. Is there any drop-in replacement for those tubes?

It should be appropriate to allow ads pertaining to hybrid equipment including accesssories.

Walt,
That would work for me as long as it was an occasional ad and
DIRECTLY related to the Hybrids only.
Tha'ts my input. It's really up to Bill and you however.

I feel an occasional notation of a kenwood hybrid or it's accessory is ok. I am in agreement with Walt in statement that we just don't want a swap section here. Perhaps a better channel of communications for thye group should be found for that sort of thing. Aplace where parts could be found, sold or swapped as well as Kenwood Tube Hybrid Radios and related accessories for the Kenwood Tube Hybrids and not limited from after market products or mods being thus related to these Kenwood Tube Hybrid Radios. These items being the subject of interest to the group.

Obviously few would want to see a swap shop where the group communicates, no more than The QSO group was to announce on the original group or the mics channel.

Perhaps it would be would be a good idea to have a place where the members of the group could post for sale or wanted for other members to look when they are searching.

You've asked for groups opinions? Well there's my persay. Thank you and I respectfully forwarded it when you've asked. Thank you for it. John. KA3DPW

You may find more information over in the archives about the 6146 tubes to help you. Go to files and look for The 6146 Family of Tubes.doc. It was written by Glen E. Zook, K9STH. Fills in the details about the tubes compatibilities.

There is also information in the same section about replacement and neutralization. Lots of good reading set there for the members by the members related to these vintage radios.

And welcome to the group. I'm John-KA3DPW. I have TS-830 .

Of course then it would mean that the administrators would have to screen each "For Sale" post to be sure that it pertains "directly" to Kenwood hybrids and likewise any "accessories". Then, how do you define accessories. I have a IHY equalizer that works great with my 830 and 599 twins. Makes a fine edition to these rigs. It's an accessory. Personally, it's easy enough to create a Yahoo Group that covers this "For Sale/Want" activity. Traditionally this group has been the key help and support for keeping the 520/530/820/830 type rigs up and running. Do you really want to dilute the reflector activity by now intertwining For Sale type ads in all the string of threads?

Personally, I have no problem with occasional posts of equipment for sale that are reasonably related to the purpose of the list. That might be a bit broader than hybrids only, such as useful test equipment for these rigs. I also like the idea of at least a starting price. What I would not want to see are posts that say "I have such-and-such on Ebay," etc.

What is "useful," "related," or "occasional"? I am content to leave that in the discretion of the moderators. If a word of warning to the wise does not do it, they know how to pull the plug.

FWIW, some of my best buys have come off of moderated lists where the seller had a known presence. That's how I got my TS 520 and TS-430S, among other things. Much better than the Ebay lottery where "I am not a ham, but I turned in on and it lights up. Sold as is," or "Sold as is. Guaranteed not to be DOA," whatever that means.

I'd suggest let's try it, and if it gets to be too much, the moderators can revisit it.

Hi, what band were you on when you found 100 watt measurment and how well did you tune? 100 on CW doesn't sound bad to me on certain frequencies. Granted it can go a little higher but there sounds like still some life left in the tubes for CW. You may want to get another set of tubes ordered for the future, but for now they should be ok based on what you have said so far. Why do you think the tubes are going bad? Back 2U

Hi,

I would be happy to see Group related Ads/Wants only (Kenwood Accs to these hybrid radios Only).
Going outside this field opens it up to one perseption of what can be attached to the radio. ie. I have a computer connected, with interface, could I say this is an acc to my TS-830, in my opinnion "NO"

I am looking for a VFO-230, and SP-230, so I would expect a sell ad for this to be allowed.

Conditions.
1. Replies to seller directly. E-mail link within the post, the reply or reply all returns to the group.
2. Price to be made on the orignal post.
3. Detailed discription of equipment.

My 2-cents worth

I agree with John KA3DPW, a new set as "spares" is a good idea. I would read the article "The 6146 Family of Tubes" by Glenn Zook. I run 6146Ws in my 820 and it works just fine, no problems neutralizing and power output is very stable on 10 mtrs.

Have you also consider aligning the 820 driver coils? A simple adjustment of the driver coils is all that is needed. Follow the service manual procedures for alignment/adjusting the driver coils. More than likely you only need a slight alignment of the driver to bring your 820 up to speed.

11154. Kenwoods For Sale (Hybirds)

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-26 19:53:28 UTC
From: Gene Hawkins
Topic: 11154 Message: 11154

Hello Gang,

I do not see anything wrong with selling Kenwood
Hybrid equipment, or the accessories that pertain
to the equipment that this list was established to
accommodate.

Heck, not knowing the difference I have already
posted a complete TS-830 station and it sold very fast.

I would much rather see a fellow Ham buy this
equipment than see it sold on E-Bay to a CB'er that
would have it butchered up for his bootleg frequencies.

If I remember correctly, when I signed on this list the folks
wanted a call sign before they let you on, and I don't have
a problem with that.

I would prefer not to have another list established just
for the selling of these rigs, but at the same time I do not
want this list full of for sale adds either.

I think to should be left up to the list owners and
administrators to decide whether they want to allow on
their lists.

Hey, all of this and about $2.00 will get you a cup of coffee
just about anywhere.

73,

Gene Hawkins
KA5CNT

John
That is because Yahoo truncated the last 4 characters from the URL.
I can't seem to get around this so will have to say that the 2 pics
are in folder VA7GEM.
Sorry about that
Barry

Hi John

Thanks for your reply. I usually operate on 80-40m and measure it
with (do not laugh) the meter included with the MFJ Versa tuner II
and a Radio Shack HF power meter.

Geoff
I have added a 3rd pic of the back side showing the numbering on the leads. Ohmeter indicates 0.1 ohm as follows with all other permutations as open:
lead 1-2
lead 3-4
lead 5-6
Same measurements when polarity is reversed.
thanks for the help
Barry

I have a TS-520. At a local ham club auction, a VFO-520S came up for sale, and I grabbed it for $25.00. There is no cable. Therefore, I have two questions. 1. Will it be possible to use the VFO-520S with a TS-520? 2. Where can I buy a cable, OR, where can I find instructions to make one? I have some old tubes; I suspect that I could use their sockets and make my own cable. Noel N2FAV Maywood, N

That's ok Marcello. I use the meter on my versa tuner five. I just wasn't sure about the question asked. Somtimes the 830 gives 100 watts here and something else there. To me that's ok barefoot. I only need 65 to drive full limit on my linear amplifier.

You may find it difficult to obtain a cable. Usually at a hamfest or an occasional listing on ebay or swap meet.

If you do need to go the route of building a cable for your radio to vfo here's what I found for you so far.

A copy of this manual is obtainable on BAMA or CD on ebay or the archives. I believe James Marolda is our courteous thoughtful member who made sure of the availability of the information. As ofr 520 to 520S differences I do not know that much. I'm 830. I knew this muchfrom persuing the information regarding another accessory of the 520. It's TV-502 unit. This is what I found for you. hope it helps. Cables for these radios other than Amplifier aftermarket might be few and far between if you go looking. I've kept the 520 manual for reference in my documents on computer. Otheres here in the group may be able to lead you better, but so far this information I can point you to.

A copy of the Kenwood SSB Transiever Model TS-520 Owners Manual shows the following information for you.

Looking bck in the TS-520manual I see a diagram in Section 2 after page 8, where in figure 1-D it shows connection of TS-520 to VFO-520.

Then on Page 10Figure 4 shows the back paneled External VFO connector. Pins 8 and 9 are jumpered.

On page 16 it shows the wiring diagram for the VFO-520 with it's pinouts.

Hope it's of help. I use remote VFO on my 830's. They're nice to have. Enjoy.

OK well I answered honestly based on the one picture I saw.

Be an interesting project I'm sure. I've never seen a 510, but I have heard of it. The first of Trio Kenwood line. The grand ole lady of tube hybrid generations.

I live the other end of the hybrid tube line. The 830 and all it's accessories. Some adapted from the 520.

I'll look now and again to see how your doing with it. Is it to keep or to sell when your done?

Definitely a keeper. The stable as of today is TS-510, TS-520, TS820.
Do need a VFO-5D & VFO-520 to flesh it out.

11166. 820 rf board question

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-27 04:18:49 UTC
From: af4at2
Topic: 11166 Message: 11166

Good evening all.

A few months ago I got an 820 with digital display,
condition unknown.

The receiver worked, the digital display was blank.

By resoldering the connectors the display now works.

I got brave and turned the heater switch on, then
switched to tune mode. I got a really high ip reading.
I turned the ip knob on the back of the rig fully counterclockwise and
it was still pegging the meter in the tune mode.
Then I got the final tube melt down along with r3 & 3.

I replaced all the resistors in the final area, all the rectifier board
resistors. Put in a used (known working set of 6146's and 12by7.

This time when I switched to tune mode I still had high ip reading
and there was a pop and smoke on the rf board (but the finals seemed
to do ok.)

On looking for physicaL evidence r-38 on the rf board is burned.

Can someone give me a starting point to troubleshoot the rf board.

Thanks
Jim af4at

11168. For Sale/WTB ads

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-27 05:08:37 UTC
From: Jim
Topic: 11168 Message: 11168

I agree with most, these ads are helpful to the extent of staying on
subject, and also not to be turned into a market alternative for the
sellers out there looking for exposure for their wares.
Limit them to posts from 'forumn members' for Kenwood Hybrid equipment
and directly related equipment addons(ie:vfo,atu,mics,etc).

Just my 2cts.

11169. For Sale Posts Rules

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-27 06:10:31 UTC
From: n9wb
Topic: 11169 Message: 11169

The response has been overwhelming in favor of permitting for sale posts with this group. We want this to be a Minor part of the traffic here.

Here are the rules. They are subject to change as necessary to avoid problems.

Rules pertaining to Occasional For Sale and Want to Buy Posts.

Members of the TS-520_820_530_830 Yahoo Group who have been members for at least 30 days may place for sale and want to buy posts no more frequently than two weeks. (14 days)

For sale posts may include sale of TS-510, 520, 820, 530, and 830 as well as Kenwood accessories intended for use with these radios. Posts relating to non-Kenwood accessories commonly used with these radios may be posted, but please use discretion.

Posts must include the make and model of the item for sale as well as an accurate description of its condition and the asking price.

When the item is sold, please make a short post to that effect.

Replies and discussions regarding these posts must be taken off of this group either by direct e-mail to the seller or To the KenwoodQSO group as directed by the seller.

Buyers and sellers are on their own. The TS-520_820_530_830 Yahoo Group its owners, moderators, or members other than the seller hold no responsibility for the accuracy of the posts or the credibility of the seller or buyer.

We do not expect that members of this group will misrepresent or in any way cheat other members. At the moderators discretion, we may choose to ban any member from making further for sale posts, or ban the member from this group entirely if we believe his posts or transactions are not of the utmost integrity.

We ask that those who buy and sell equipment as a main business not post here. We will allow posts from members who occasionally restore and sell equipment.

We expect our members to use discretion. If excessive traffic develops as a direct result of these postings, they may have to be discontinued.

Walter Breining, N9WB

11170. For sale and WTB posts

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-27 06:52:59 UTC
From: n9wb
Topic: 11170 Message: 11170

First, I would like to thank all of you who responded to my request for your opinion concerning For Sale posts.

How successful this is depends on the discretion of the members. I did not want to limit everything to Kenwood brand, however, please do not post things that are very general in nature. For example, it you have an antenna or a roll of coax for sale, it would be better advertised on other groups. Rack audio gear would be better posted other places. However, a Heil mike wired for a Kenwood would be acceptable.

Some items are well suited for this focused audience. Others could be marketed anywhere.

If one of us has a nice TS-820 that we have been using and then upgraded to a TS-830, this will give this person a way of letting know it is available. This person can offer it to people whom he is familiar with.

My previous message listed the rules regarding For Sale and WTB ads. We may need to fine tune them after I see how much trouble I have gotten us in to. Hi.

The rules have also been posted in the Files section of this group.

Vy 73, Walt N9WB

The control grid of your finals requires a negative voltage to keep it from drawing excessive current. If it does not have this "Bias" voltage, the tubes will burn up and damage the cathode resistors R2 and R3. When transmitting, this negative voltage is reduced to allow the tube to draw 60 MA of cathode (plate) current. I suspect that you have lost this bias voltage.

First, remove the tubes. Position the plate caps so they do not get into mischief. Next remove Q5 from the RF board. This is a 2sc1515. Check it with your ohm meter.

To do this position the flat side with the beveled top toward you and have the legs pointing down. The right lead is the base. The center lead is the base. The left leg is the emitter.

Place the black ohm meter lead on the base and the red meter lead on the collector. It will either read a high or low reading.
Now reverse the leads and do the same thing. It should read high with the leads one way and low with the leads the other way.
If it shows low both ways, it is shorted.

Now do the same thing but this time between the base lead and the emitter lead. Again, it should read high with the leads one way and low with them the other way.
If it shows low both ways, it is shorted.

Let us know if it appears to be shorted as you will need a new transistor.

Next Place your volt meter on DC volts. Find the center wiper of the bias adj. pot on the back of the radio. With the tubes still out and the SG switch on the back off, turn the radio on. Place the mode switch in USB. With the red volt meter lead on the center of the bias pot and the black lead to chassis ground, measure the voltage at the center of the bias pot. Observe this voltage while rotating this pot. It should change from one extreme to the other. Turn the radio off.

Remove the damaged C-38. Measure the ohms of D-7 with the leads one way and then the other. One way should read much higher than the other.

Now. on the RF board, locate the connector RF2 and R-25. Place the meter on DC Volts and a scale that will read 100 V. With the rig back on, measure the voltage on the ends of R-12. Do this with the red volt meter wire on the chassis and place the black meter wire on R-12. One end should read around -100 VDC.

Let us know what you find and we can go from there.

Subject: [TS-520_820_530_830] 820 rf board question

Good evening all.

A few months ago I got an 820 with digital display,
condition unknown.

The receiver worked, the digital display was blank.

By resoldering the connectors the display now works.

I got brave and turned the heater switch on, then
switched to tune mode. I got a really high ip reading.
I turned the ip knob on the back of the rig fully counterclockwise and
it was still pegging the meter in the tune mode.
Then I got the final tube melt down along with r3 & 3.

I replaced all the resistors in the final area, all the rectifier board
resistors. Put in a used (known working set of 6146's and 12by7.

This time when I switched to tune mode I still had high ip reading
and there was a pop and smoke on the rf board (but the finals seemed
to do ok.)

On looking for physicaL evidence r-38 on the rf board is burned.

Can someone give me a starting point to troubleshoot the rf board.

Thanks
Jim af4at

Walt,

You have made a very sensible and important suggestion i.e., collect
those books. Over the years I have 'grabbed' and hoarded every Ham
Radio book I could get my hands on. The only regret you will have is
that you never have enough time to read them. I have books going back
to the 1920's, including one where wireless experimentation consists
of a home made spark transmitter and a coherer!

Remember, that until the 1940's science teachers were still teaching
that current flowed from positive to negative despite John Fleming's
invention of the Diode in 1904 proving them wrong.

Sadly, the young folk of today think that they know it all, when in
fact they lack a lot of the history!

From: Darwin, Keith
Topic: 11170 Message: 11176

I'm rather baffled at the apparent concern that the list will be overrun by for sale ads. Think about this from a seller's perspective. If I have a roll of coax or an Icom rig to sell, why would I post it in a Kenwood Hybrids SIG list? Why limit my audience? Instead a smart seller will post it in a general place to hit the widest audience.

For that reason I believe that the ads you're likely to see here would naturally be Kenwood related and would therefore be rather infrequent. My experience on other lists is that for sale ads are not nearly the issue that folks fear they'll be.

I'm glad to see that this list at least has the flexibility and openness to discuss the topic on list and to adjust the rules accordingly. Bravo, BRAVO!!!

Now, as to the limit of posing ads no more frequently than every 14 days and only if you've been a member for 30 days - be prepared for issues. I can see it now, new person REALLY wants an 830s and joins the list. Their first post is an introduction post. Second post is a want ad for an 830s and now they're in violation of the 30 day rule. Or, someone just picked up a complete 820s system and is selling off their 520 station. They list the 520 and when it sells, then want to list the rest of the accessories. Oops, that's 2 ads in less than 14 days. These may sound like trivial things but good people have been lost from other lists over issues just like these.

73 all!

From: BRENT BAUM
Topic: 11160 Message: 11177

The VFO 520 to TS 520 connection is straight forward. Find the right size plugs and then begin connecting the pins. Pin 1 goes to Pin 1, 2 to 2, etc. I made my own plugs using brass brads, the caps from contact solution bottles (just the right diameter) and some non-conductive epoxy to hold it all together.

Sales and etc., are a problem on some of the Groups I belong too. At times it can become very irritating. However, we have very good Moderators on this Group, so let's leave it to their good judgement. I am sure that they will soon sort out any attempt to exploit!

There are far worse problems than sales and etc., one radio site, Un-Moderated, was bombarded with propaganda promoting a certain religion, the name of which, being a 'Brit', I'm not allowed to mention, in case I offend a Minority!

11179. For Sale Ads

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-27 18:20:35 UTC
From: Stephen
Topic: 11179 Message: 11179

Is this group not for the dissemination of info and group(community) help with the repair and upgrade of one anothers personal TS520,530,820, 830's?
I've read many posts of individuals who buy defective units, use the groups resources and others to get them running and then turn a profit with the resale of the unit. Then, it's off to repeat the cycle. Is this a hobby or a business?
Would not ads create a bazaar atmosphere and lead to more of this sort of wheeling and dealing?
Might not the unrestricted posting of Kenwood hybrids and accessories lead to this becoming a for sale bullentin board? For after all, we are are a captive audience with a slightly higher then average interest in these machines.
Just the musings of one lowley amateur.

Stephen...

That is why we have moderators. And I don't believe for one second
that allowing the occasional post by a member who has some hybrid
related gear for sale will spell the beginning of the end for our
group. I belong to many groups and this one easily has ten times the
traffic and I enjoy reading each and every post. Let the moderators
worry about the things you mentioned and just sit back and enjoy this
great group.

BTW, I'm looking for donations of an SM220 monitor scope!!

OK, someone has to be first. Might as well be me. <smile>

For Sale. Ideally to be collected from Lancashire UK.

TS520SE Serial # 0030556.
Clean but probably not the prettiest in town [like it's owner]
Complete and working [bar the toggle over the S/R switch]
Good valves - 100watts on all bands.
Complete with Shure 444D desk mic.

Shall we haggle around the £75-00 mark ?

Please contact via m5aav@...

Stephen,
I ocassionaly buy dead or units in need of repair. I then fix them,
align them and resell them. It is truely a Hobby and not a business.It
is very hard to turn much of a profit(if at all) when doing this. I
do it because I enjoy taking something that doesn't work or work
correctly and making it whole again. It is very satisying !
The Moderators here will keep a close eye on what goes on.
I personally check every message here daily.
73,
Gordon

Jim,
What "IP" knob are you referring to on the back of the rdaio? The SG
bias or the RF adjustment?

Keith:

Thank you for your comments and they were some good points. Some of the rules are due to bad experiences on other lists. I see a great amount of fine tuning of these rules as we see what happens. Some of those changes will likely address some of the concerns that you expressed.

I have seen situations where individuals joined every group that they could to advertise something that was way off topic and took the shotgun approach of barraging as many groups as possible with their posts. Then they posted daily or more often. After they disposed of their item, they unsubscribed from most of the groups. This is the kind of abuse I wish to avoid.

In the event that a newcomer wants to buy an item I am sure that we can find a way to accommodate this person. I think we are going to learn a lot.

Subject: RE: [TS-520_820_530_830] Paranoia over For sale and WTB posts?

I'm rather baffled at the apparent concern that the list will be overrun by for sale ads. Think about this from a seller's perspective. If I have a roll of coax or an Icom rig to sell, why would I post it in a Kenwood Hybrids SIG list? Why limit my audience? Instead a smart seller will post it in a general place to hit the widest audience.

For that reason I believe that the ads you're likely to see here would naturally be Kenwood related and would therefore be rather infrequent. My experience on other lists is that for sale ads are not nearly the issue that folks fear they'll be.

I'm glad to see that this list at least has the flexibility and openness to discuss the topic on list and to adjust the rules accordingly. Bravo, BRAVO!!!

Now, as to the limit of posing ads no more frequently than every 14 days and only if you've been a member for 30 days - be prepared for issues. I can see it now, new person REALLY wants an 830s and joins the list. Their first post is an introduction post. Second post is a want ad for an 830s and now they're in violation of the 30 day rule. Or, someone just picked up a complete 820s system and is selling off their 520 station. They list the 520 and when it sells, then want to list the

rest of the accessories. Oops, that's 2 ads in less than 14 days.
These may sound like trivial things but good people have been lost from
other lists over issues just like these.

73 all!

11194. Re: [TS-520_820_530_830] transverter for 830s

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-28 01:23:06 UTC
From: John Harp
Topic: 11175 Message: 11194

There is the TV-506 transverter for 6 meters and a TV-502 for 2 meters both meant to be an accessory to the TS-520, but it is adaptable to the 830.

The connector pinouts are located in the 830 owners manual and the 520 owners manual. Finding a cable for the 502 to 520 will take some time, unless your fortunate enough to get a cable over ebay or swap or if the unit already comes with one.

You could adapt it since one end is different to the 830. Connectors are hard to find for the transverter end. Thus a little creativeness is needed for the adaption. I myself am making a cable for the TV-502 to 830. I bought two without manuals or cable. One of which is moded and missing a top. I intend to use it for parts or change it up to 1.25 meters.

I got both for 80 and 50 bucks. A complete unit with cable and manual will cost more. Recently one sold for 175 and another for about 150. Watch ebay if your interested in going this way. I'm looking for a TV-506 next.

There are other transverters out there to use with the 830. Down East Microwave is a place to look. Some appear on ebay from time to time.Depends on what you want to work and what frequency you want to transvert to and from.

You have a good set up there. I have all those accessories with my 830's. I've operated 830 since the early 80's. Won't part with them either.

Feel free to ask questions and watch and learn. There's always something going on here. We may not know everything, but we'll give it a shot. It's an active group and growing. We have an archive provided by the members and for the members. It's a good resource, so look around and enjoy. welcome to the group. My name is John- KA3DPW. Back to you.

n9wb <n9wb@...> wrote: The response has been overwhelming in favor of permitting for sale posts
with this group. We want this to be a Minor part of the traffic here.

Here are the rules. They are subject to change as necessary to avoid problems.

Rules pertaining to Occasional For Sale and Want to Buy Posts.

Members of the TS-520_820_530_830 Yahoo Group who have been members for at least 30 days may place for sale and want to buy posts no more frequently than two weeks. (14 days)

For sale posts may include sale of TS-510, 520, 820, 530, and 830 as well as Kenwood accessories intended for use with these radios. Posts relating to non-Kenwood accessories commonly used with these radios may be posted, but please use discretion.

Posts must include the make and model of the item for sale as well as an accurate description of its condition and the asking price.

When the item is sold, please make a short post to that effect.

Replies and discussions regarding these posts must be taken off of this group either by direct e-mail to the seller or To the KenwoodQSO group as directed by the seller.

Buyers and sellers are on their own. The TS-520_820_530_830 Yahoo Group its owners, moderators, or members other than the seller hold no responsibility for the accuracy of the posts or the credibility of the seller or buyer.

We do not expect that members of this group will misrepresent or in any way cheat other members. At the moderators discretion, we may choose to ban any member from making further for sale posts, or ban the member from this group entirely if we believe his posts or transactions are not of the utmost integrity.

We ask that those who buy and sell equipment as a main business not post here. We will allow posts from members who occasionally restore and sell equipment.

We expect our members to use discretion. If excessive traffic develops as a direct result of these postings, they may have to be discontinued.

Walt,

You have made a very sensible and important suggestion i.e., collect
those books. Over the years I have 'grabbed' and hoarded every Ham
Radio book I could get my hands on. The only regret you will have is
that you never have enough time to read them. I have books going back
to the 1920's, including one where wireless experimentation consists
of a home made spark transmitter and a coherer!

Remember, that until the 1940's science teachers were still teaching
that current flowed from positive to negative despite John Fleming's
invention of the Diode in 1904 proving them wrong.

Sadly, the young folk of today think that they know it all, when in
fact they lack a lot of the history!

Subject: Re: [TS-520_820_530_830] Re: am I losing power/efficiency to
the antenna when...

Frank:
You made my day.

Speaking of publications, somebody asked me what to look for at
Hamfests in
the way of technical material. I will make these suggestions.

Look for any used ARRL handbook, no matter what year.
Look for ARRL Antenna Handbooks no matter what year.
By no matter what year I am talking very olde to current.

Radio Handbook by Bill Orr. Any edition

Here is an interesting web site http://www.cebik.com/radio.html

It will provide you with a lot of interesting reading.

I also want to thank all of those who are contributing to this group with
advice and information. All of us working together passing on our knowledge
and experience will enable others to revive some of these great olde rigs
and revive the technical aspect of Amateur Radio.

We have heard about the olde days when the local hams mentored (Elmered)
aspiring ham on a one on one basis. In today's world this is more difficult.
It seemed that this was a dying art. But with the internet, one ham can
Elmer another anywhere in the world and one ham can have access to the knowlege of many Elmers.

I do not believe that God gave us knowledge to hoard. As we gain knowledge,
we are to pass it on to others.

Hi James,
Looks like we may get company soon with transverters James. Gonna start on mine soon. just got plastic up on the windows in the shack.

Heat is next. Get the mic going and the phone patch and the transverter.

Bought stuff to make the cable with, but not all of it yet.

Bought a battery and solar regulator for solar addition solar panel is asked for in the christmas wish list. This winter will be a pleasant one occupied in free time getting this all together and on the air too.

This year is turning out to be a good year after all. Better job, better pay and more free time. I needed this.

11202. Re: [TS-520_820_530_830] 820 rf board question

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-28 02:16:31 UTC
From: John Harp
Topic: 11166 Message: 11202

My initial response at this point is:

1) replace R38 and see what it is for.

2) look over the entire plate circuit thoroughly and clean if need be to be sure to see everything, a good going over. Somethings pulling alot of current on the plates. Look your chokes over good too.

3) Watch and check over the power supply. If need be do save the transformer.

See what comes back for response.

af4at2 <af4at2@...> wrote:
Good evening all.

A few months ago I got an 820 with digital display,
condition unknown.

The receiver worked, the digital display was blank.

By resoldering the connectors the display now works.

I got brave and turned the heater switch on, then
switched to tune mode. I got a really high ip reading.
I turned the ip knob on the back of the rig fully counterclockwise and
it was still pegging the meter in the tune mode.
Then I got the final tube melt down along with r3 & 3.

I replaced all the resistors in the final area, all the rectifier board
resistors. Put in a used (known working set of 6146's and 12by7.

This time when I switched to tune mode I still had high ip reading
and there was a pop and smoke on the rf board (but the finals seemed
to do ok.)

On looking for physicaL evidence r-38 on the rf board is burned.

Can someone give me a starting point to troubleshoot the rf board.

Thanks
Jim af4at

11203. TS-520 2SC856 transistor replacement

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-28 01:59:18 UTC
From: Karl Schwab
Topic: 11203 Message: 11203

Fellow TS-520 guys; My loss of ALC in my TS-520 'could be' because of a bad Q10, 2SC856 transistor on the RF board. In looking at Q10 on the board, it looks like it might take a 'bit of doing' to get it off of the board; my though is take it off from the top so as not to get into 'to much trouble'in trying to remove the board! In looking on the Internet for a source for this transistor, it appears to be a discontinued item. I would like to know if any of you might have a source for a replacement? As always, thanks for your help. 73, de KO8S, Karl

There is a file on the TS-820 VFO cable, but, nothing for the 520. Also, it appears that the TS-520 needs a 8 pin plug, while the VFO-520S requires a 9 pin plug. I will not be able to wire them in a 1 to 1 sequence.

I suspect that you may have missed the fact that I am attempting to use an "S" VFO on a plain TS-520. This is why I asked if it will work, and if anyone on this group has used this particular set-up?

11206. FS: MC-35S Noise-cancelling microphone

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-28 05:20:13 UTC
From: Jim
Topic: 11206 Message: 11206

In accordance with the new policy, I'm offering for sale an accessory I received with my TS-530SP.

It's the Kenwood MC-35S noise-cancelling hand microphone, brand new and unused, still in the plastic sleeve in the box. I've never used it and never will, so it's available.

These mics are rare, and a brand new one is next to impossible to find. I'll double-box it and ship it in the continental U.S. for a postal money order for $65.

Please contact me off the forum. I'm OK in QRZ.com.

73, Jim KM5M

From N9WB:
This is a high Z dynamic hand mike. The manual is posted in the Files section of the KenwoodMics Yahoo group.

11208. Re: [TS-520_820_530_830] TS-820S Final Tubes replacement?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-28 10:06:04 UTC
From: n9wb
Topic: 11139 Message: 11208

The output of this rig depends on the line voltage when you are keyed down. If you are using an extension cord or an outlet strip this may be reducing the line voltage. If into a dummy load you can get 85 watts on 28.350, and 100 watts on 40 meters, I would leave it alone. Especially if you have S-2001's installed. If your line voltage is less than 117 volts, 100 watts is real good. Remember, you would have to drop to 50 watts to loose 1/2 S unit.

Hello to All
I'm new in this group, recently upgraded to General and purchased a TS-820S XCVR which works fine but it puts out ~100W in CW. I wonder if this is an indication that I should start thinking on replace the final tubes. The manual calls for S2001 tubes which I think are obsolete. Is there any drop-in replacement for those tubes?

I wish I had the money for it. I had one of those back in college, when I had my TS-520S. I also used it with my FT-101B. That's a good mic. If I remember right, It has a toggle switch of sorts on top of the mic, to activate the noise cancelling circuitry. Oh well.

hi Noel,

the vfo uses the 9 pin socket on the rear of the 520x or 820x models,
the 8 pin (larger) socket is for amplifier (and alc) connections.

the cable is straight 1-1...9-9 pin 7 not used.

the IF for the 520 and 520s are equal so you can use the vfo.

(anyone please correct me if I am wrong !)

From: BRENT BAUM
Topic: 11160 Message: 11214

Noel,
The "S" model VFO is the same as the regular 520 VFO except for the back plate on the frequency dial; it's gray to match the panel on the 520S, whereas the 520 and VFO-520 have white back panels. Aren't cosmetics nice?

The VFO connects to the small nine pin connector on the upper right of your back panel, not to the larger, usually brown colored, 8 ping remote connector below it. If you have an 8 pin connector in the upper right location your radio has a modification of some sort. Also, only 8 of the 9 pins are used in the cable and the connectors. If I remember correctly pin 7 is actually "floating" so you can use a 4 pair cable, I used some 4 pair LAN cable to make my connection. Just be sure that the floating pin is the same one on both ends.

My station set up includes TS-520SE, VFO-520S, SP-520, DG-5, and a TV-506.

Good luck,
73 de K7MEI Brent

Mine has the Pan-Adaptor, but for some reason the data showing how to connect it to a TS-530 is not in the manual, so my fitting is bit of a bodge. The PCB appears to have pads, but I do not have details of the components needed.

Please, has anyone attached an SM-220 to a TS-530?

This is in the group files, courtesy of Cliff(at)Avvid(dot)com:

To align the bandswitch sections;

Put the radio on 10Mhz. The flats on the shaft should be vertical.
Check the shaft in the final compartment. There should be a flat to
the outside (right side of radio viewed from front) and one to the
bottom. This is the correct alignment.

Besides a lot of Ham stuff that used 6146/6146A's back when, a lot of the land/mobile equipment also used them. I cannot recall any hamfest over the last several years where I didn't see at least one vendor selling 6146's. If you're into 6146's with 12 volt filaments, there's also the 6883's.

11233. TS-830S with LED'S lit all the time

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-29 03:04:55 UTC
From: davewalinski
Topic: 11233 Message: 11233

I have a TS-830S that the both LED lights on the RIT
and the LED on the RF attenuator are lit all the time
reguardless of weather the RIT or RF Attn. switches are actually on or
not.
The radio otherwise works great. Also the led's are a slight bit dimmer
with switches off then reach regular brilliance with switchs on.
Any one else have this problem? Thank you.

Hi Marcelo,

My TS-820S with original S2001A tubes still puts out 100W on 10M and
120W on 75M. I bought the radio in 1977 and I would say that the
power out may be down 5 watts from when it was new. These
measurements were taken with a Bird 43 (250W slug), Thermaline 8135
RF load and a key-down voltage of 117VAC.
Under the same conditions, my TS-830S (original 6146Bs) puts out 110
on 10M and 130W on 75M.
Another item to check when power output is a little lower than
expected is the screen supply voltage (about 210V).

73,
Mitch

11238. RE: [TS-520_820_530_830] Paranoia over For sale and WTB posts?

Yahoo group: TS-520_820_530_830 (2006)

From: John Harp
Topic: 11170 Message: 11238

Well Walt when you rhink about it. We know each other here. We know were here to keep these radios running. That's this groups goal. To experience them in thier fineness and pass that pleasur on is within the scope. Other vintage groups have gone on the same path as we and done well, some adaption may be deemed necessary at times. But if we all use this resource correctly, look at our potential gain. It's gonna take trust, respect, and application of the saying " there's no I in team".

We'll know when profitable business is a foot. When swap shop ads are bigger than the important stuff it is a guage. We as members know each other to well, we talk to each other ,we know each other and our goals. If there's anything that marks how one is known it's the results of thier works.

You've done well at bringing this group along. Others have come on side you to assist, and are doing good work too.

Our tools are more than screw drivers and hammers and soldering irons. We have knowledge and know where to inquire or to look.

You know when each one of us joined who we were and what we were about and what we were looking for. More so than we back then.

You gave it opportunity. You set guidelines. It grew and it got better as time advanced.

Now we've added a new tool. Lets have confidence and jump in with both feet, everybody. We know the drills. We know we can get it right.

Let's go.

"n9wb@..." <n9wb@...> wrote:
Keith:

Thank you for your comments and they were some good points. Some of the
rules are due to bad experiences on other lists. I see a great amount of
fine tuning of these rules as we see what happens. Some of those changes
will likely address some of the concerns that you expressed.

I have seen situations where individuals joined every group that they could
to advertise something that was way off topic and took the shotgun approach
of barraging as many groups as possible with their posts. Then they posted
daily or more often. After they disposed of their item, they unsubscribed
from most of the groups. This is the kind of abuse I wish to avoid.

In the event that a newcomer wants to buy an item I am sure that we can
find a way to accommodate this person. I think we are going to learn a lot.

Subject: RE: [TS-520_820_530_830] Paranoia over For sale and WTB posts?

I'm rather baffled at the apparent concern that the list will be overrun by for sale ads. Think about this from a seller's perspective. If I have a roll of coax or an Icom rig to sell, why would I post it in a Kenwood Hybrids SIG list? Why limit my audience? Instead a smart seller will post it in a general place to hit the widest audience.

For that reason I believe that the ads you're likely to see here would naturally be Kenwood related and would therefore be rather infrequent. My experience on other lists is that for sale ads are not nearly the issue that folks fear they'll be.

I'm glad to see that this list at least has the flexibility and openness to discuss the topic on list and to adjust the rules accordingly. Bravo, BRAVO!!!

Now, as to the limit of posing ads no more frequently than every 14 days and only if you've been a member for 30 days - be prepared for issues. I can see it now, new person REALLY wants an 830s and joins the list. Their first post is an introduction post. Second post is a want ad for an 830s and now they're in violation of the 30 day rule. Or, someone just picked up a complete 820s system and is selling off their 520 station. They list the 520 and when it sells, then want to list the rest of the accessories. Oops, that's 2 ads in less than 14 days. These may sound like trivial things but good people have been lost from other lists over issues just like these.

73 all!

Topic: 11233 Message: 11241

When on, the switch applies voltage to a resistor that connects to the LED. The ground side of the LED goes directly to ground. So voltage has to be somehow leaking past the switch contacts. Dirt buildup around the switch can cause this or a resistive short in the switch. I would suggest cleaning the switch with De-Oxit (Best) or rubbing alcohol. If rubbing alcohol is used, give it a bit of time to fully dry.

Somehow, voltage has to be getting to the LED circuit in spite of the switch contacts being open.

I have a TS-830S that the both LED lights on the RIT
and the LED on the RF attenuator are lit all the time
reguardless of weather the RIT or RF Attn. switches are actually on or
not.
The radio otherwise works great. Also the led's are a slight bit dimmer
with switches off then reach regular brilliance with switchs on.
Any one else have this problem? Thank you.

Before you remove Q-10, why do you think it is bad? Measure the voltage on the base, collector, and emitter of this transistor. Let us know what you get. Use a digital volt meter if available.

For an exact replacement check Mouser.

http://www.mouser.com/

Or CEI

http://www.ceitron.com/products.html

Mouser will be more expensive but CEI has a $25.00 minimum.

Order by 800 # telephone for best results on both.

But first, lets check farther and see if Q-10 is really bad.

Subject: [TS-520_820_530_830] TS-520 2SC856 transistor replacement

Fellow TS-520 guys; My loss of ALC in my TS-520 'could
be' because of a bad Q10, 2SC856 transistor on the RF
board. In looking at Q10 on the board, it looks like
it might take a 'bit of doing' to get it off of the
board; my though is take it off from the top so as not
to get into 'to much trouble'in trying to remove the
board! In looking on the Internet for a source for
this transistor, it appears to be a discontinued item.
I would like to know if any of you might have a
source for a replacement? As always, thanks for your
help. 73, de KO8S, Karl

Ellen AF9J and Myself N9WB Started a Yahoo group a few months ago. It is called KenwoodQSO. This is a group where users of this and other specific groups can post frequencies where they are listening and calling CQ. We are restoring some super rigs, we need to talk to each other on them. Often we hesitate to break into existing conversations because we wonder if we are welcome. Anyone who posts on the KenwoodQSO group welcome others to join them. That means YOU!. We also encourage you to post.

Eventually, when band conditions improve, Ellen wants to start a Kenwood Hybrid net. Band conditions have been terrible this winter so success has been marginal, but the more people we have participating and the more often they post, many of us who have become friends here will be able to talk on the air. We are at the very bottom of the sunspot cycle, but reverse sun spots have already been observed. Conditions have no way to go but up to what is predicted to be one of the best cycles in my lifetime! I am 57.

We do not have this group listed in the Yahoo directory. If you wish to join, you can search Yahoo Groups for KenwoodQSO or e-mail Ellen or myself and we will send you an invitation.

We have two other groups, one is KenwoodMics where the discussion of mikes on Kenwoods as well as improved audio can take place and astaticmicrophones. This group was established by Frank K2NCC for us to discuss Astatic repairs and modifications.

If you are a member of this group, you are welcome to join these additional groups.

Nothing to do with Radio:

When you are repairing books and etc., get the proper library tape, it lasts almost forever, doesn't dry out, and is almost invisible. Sellotape dries out, peels off and generally leaves the paper in a mess.

You will have to ask for it, good stationery dealers should have it. If not, ask you local library or second-hand bookseller, they will be happy to advise you.

There is a file on the TS-820 VFO cable, but, nothing for the 520. Also, it appears that the TS-520 needs a 8 pin plug, while the VFO-520S requires a 9 pin plug. I will not be able to wire them in a 1 to 1 sequence.

I suspect that you may have missed the fact that I am attempting to use an "S" VFO on a plain TS-520. This is why I asked if it will work, and if anyone on this group has used this particular set-up?

Topic: 11243 Message: 11249

Hi everybody,

As Walt mentioned, him and I own the Kenwood QSO group. We are at the bottom of the solar cycle. As a result of this, even 40 is long by 7 PM (not to mention, having horrendous BCI at night). BUT, 75m/80m has been doing better. I belong to a Hellschreiber group (the Feld Hell Club), and run their 80m net on Tuesday nights. Last night, using just 80W from my rig (a Yaesu FT-897D - sorry, I reserve Ms. TS-820 for relaxed SSB & CW QSOs) I ahd check-ins from coast-to coast on 3587 kHz. I think it may be worth it to try a Kenwood net on 75m. In the past, this would have been tatamount to comitting RF suicide, with all of the activity on 75. But with the Omnibus ruling taking effect on Dec. 15, the phone band will be opening up quite a bit. Extras like will be able to work all the way down to 3600 kHz. Advanced Class licensees will be able to work down to 3700 kHz, and Generals will be able to work down to 3800 kHz.

Could you all provide me with some feedback? Do you think that a 75m Kenwood net would be doable? If so, what frequency or frequencies do you recommend (especially since I'm not that familiar with the nets on 75). In my personal opinion, somewhere around 3805 kHz might be good, to include all members in the net who are General Class or higher. Please give me some feedback.

73,
Ellen - AF9J

P.S. - BTW, I'm eveng ame to try a net on 160m, I made some antenna revisiis recently that have really improved my low band signal.

Ellen,

I think there is a DX window somewhere around 3800 KHz. You may want to investigate that. As a VE3 I can roam freely from 3500 - 4000 so any freq you pick is fine with me, but others may have a problem. My suggestion would be somewhere above 3900. Lots of rag chewers between 3700-3800 but activity above 3900 seems a bit lighter.

hi
I would be interested in a net at 3805.

Ellen, In my opinion 3805 is not a good pick...there is a group that hangs out there but most importantly, it is just above the DX window and when the DX station is running split 3805 will be right in the middle of the US calling frequency and the DX'rs will not care that you were there first...for what it worth...73...Jeff...W0XV

Hi everybody,

As Walt mentioned, him and I own the Kenwood QSO group. We are at the bottom of the solar cycle. As a result of this, even 40 is long by 7 PM (not to mention, having horrendous BCI at night). BUT, 75m/80m has been doing better. I belong to a Hellschreiber group (the Feld Hell Club), and run their 80m net on Tuesday nights. Last night, using just 80W from my rig (a Yaesu FT-897D - sorry, I reserve Ms. TS-820 for relaxed SSB & CW QSOs) I ahd check-ins from coast-to coast on 3587 kHz. I think it may be worth it to try a Kenwood net on 75m. In the past, this would have been tatamount to comitting RF suicide, with all of the activity on 75. But with the Omnibus ruling taking effect on Dec. 15, the phone band will be opening up quite a bit. Extras like will be able to work all the way down to 3600 kHz. Advanced Class licensees will be able to work down to 3700 kHz, and Generals will be able to work down to 3800 kHz.

Could you all provide me with some feedback? Do you think that a 75m Kenwood net would be doable? If so, what frequency or frequencies do you recommend (especially since I'm not that familiar with the nets on 75). In my personal opinion, somewhere around 3805 kHz might be good, to include all members in the net who are General Class or higher. Please give me some feedback.

73,
Ellen - AF9J

P.S. - BTW, I'm eveng ame to try a net on 160m, I made some antenna revisiis recently that have really improved my low band signal.

and calling CQ. We are restoring some super rigs, we need to talk to each other on them. Often we hesitate to break into existing conversations because we wonder if we are welcome. Anyone who posts on the KenwoodQSO group welcome others to join them. That means YOU!. We also encourage you to post.
>
> Eventually, when band conditions improve, Ellen wants to start a Kenwood Hybrid net. Band conditions have been terrible this winter so success has been marginal, but the more people we have participating and the more often they post, many of us who have become friends here will be able to talk on the air. We are at the very bottom of the sunspot cycle, but reverse sun spots have already been observed. Conditions have no way to go but up to what is predicted to be one of the best cycles in my lifetime! I am 57.

As Jeff pointed out, around 3800 is probably not a great area to hang. I believe a Collins net also meets on or about 3805 too. Many of the current 75 meter residents are talking up moving down into the new areas to gather dominance. Your best bet is to consider moving somewhere above 3900 where empty space still can be found at times during the evenings.

During sunspot minimum, 80 and 160 meters generally are better for "quiet band" operation with less static and longer haul contacts. However, keep in mind that during the winter months, D and E absorption virtually disappears during the evening hours. 80 meters signals will propagate up to the much higher layers resulting in much longer "skip" type conditions. Your ability to work stations, 200 to 400 miles or less, might be constrained at times.

Hi Max,

I deal with DX wndow you're talking about a fair amount, when I'm contesting. The window in question is supposed to be from 3775 to 3800 kHz. But the defacto window is from 3790-3800 kHz (almost everybody ignores 3775-3790 as being a part of the window).

My only conern about going above 3900, is that there are many established nets above 3900, which makes it hard to find a clear freq. for another net. If it would be above 3900, what would people suggest we use?

73,
Ellen - AF9J

OK, around 3805 is out. Where could we hold it above 3900? Any ideas from those of you who know what the net situation is between 3900 & 4000 kHz. I'd love to do one on 160 (I've liked that band since the mid 80s, when I was a new General class licensee, using the University of Wisconsin's club station), if I have enough people inetersted in it. I'll try a test net on 160. My only concern about 160, is that many hams will have a hard time getting anything to radiate OK on 160 (I just got lucky in that regard). So, it would not be a good choice for the main net. A net on 160 would be more of a "doing it for a laugh" net. I guess, I'm hoping that the DX Window, and some of the nets below 3850 would move down lower in freq. after Dec. 15. It sounds like this won't be the case.

Actually, if you're going to act as net control or central point of
contact, you need to have the "best" frequency. I can tell you what I
hear at my location as a clear frequency but at your location, it might
be entirely different.

Occasionally, I have heard the other side of The Pond in our forbidden section, 3.8 to 4.0 Mcs, Oops sorry MHz, it's my age you know. But, any chance of hearing you between 3.5 and 3.8 is almost impossible, the continental Gentlemen ??? swamp the band. It is sometimes difficult to run a local Net. They seem to have contests day and night at times. Good manners, and good operating disappear in their efforts to collect yet another number.

There you are you see, I'm a typical aged xenophobic 'Brit'. ;-)

Ellen,

I think there is a DX window somewhere around 3800 KHz. You may want to investigate that. As a VE3 I can roam freely from 3500 - 4000 so any freq you pick is fine with me, but others may have a problem. My suggestion would be somewhere above 3900. Lots of rag chewers between 3700-3800 but activity above 3900 seems a bit lighter.

We had cats, Siamese, now they are special, except for one or two things. They are expert thieves and can open doors. But, in our case they are professional killers, rats, mice, and rabbits, that's OK. Unfortunately, we have 35 acres of conservation managed land, and they killed anything that moved, crawled, ran, or flew, we even had a neutered tom who could fish. So, as they went to cat heaven they were not replaced. We miss their special ways, but it was not much use preserving all the birds and etc., for them to be slaughtered.

So now we rescue elderly Pekingese dogs, again they are special, and one of the breed won Crufts, (Danny). The dogs are getting old, like us, so these will be the last.

As a well known personality said, "If our pets aren't in Heaven, then I don't want to go".

73 Ron G8URU

P.s. Walt, your cats do like you, they just have a funny way of showing it, after all they know that they are superior to humans. The ancient Egyptians got it right. R.

80 dead?, I worked CQ WW CW this past weekend, some of the prefixes I worked were: M6, SH9, DL7, YT1, IU1, SN7, SH0, F8, EA3, 9A, IK2, OM4, Ok, IZ3 and this was all on the lower end of 80 using a dipole all twisted in different positions to fit in the yard.
It's hard to come up with something for everyone, our club has a local net on 10m and sometimes we can't hear someone 20 miles away, even with the beam "looking" right at them.
Sometimes an e-mail might be the best thing, this way you can set up a quick QSO if you find an open spot on some band and others that are reading the mail can join in on the air.

Good morning/evening group,

While I am quite happy with the new policy of members occasionally offering their spare bits and pieces for sale within the group, I do think that the moderators need to keep a close eye on the recent spate of animal stories.

I think we should allow only those pet stories which are directly related to our hybrid radio treasures, with mention of a maximum of two pets per month - NO CHICKENS!

My cat Boofie (short for Boofhead) regularly sleeps on my desk nestled up alongside the TS-530S. I need to do a little fur-removal maintenance at times, but am pleased to say that I've never been troubled by mice in the shack.

Regards to all

Walt,

You know about my cats. I should sent you the photo (maybe I did) of Cleo laying on top of the IC-703 Plus I had last February. It was during the ARRL CW DX contest. Every time I turned the tuning dial, she swatted at my hand and meowed! Still, I wouldn't be without her or Sugar.

73,
Ellen - AF9J, w/ Cleo purring, and swishing her tail in front of the notebook screen.

As do my cats Ron,

I have 2 shorthairs, that I adopted from a no-kill cat shelter I volounteer at. Cleo (my black & white, who's swishing her tail in front of the screen as I write this), and Sugar (my tortie) oftentimes hang out with me, when I'mm on the radio, and occasionally try to be my 2nd operator. LOL

73,
Ellen - AF9J

11266. Re: [TS-520_820_530_830] TS-830S with LED'S lit all the time

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-30 01:27:07 UTC
From: John Harp
Topic: 11233 Message: 11266

I don't have shematics available to me at the moment, but alot of times in a digital circuit with LED's they are tied high to source or low to ground. I bet ground in this case. Check your ground. It sounds like a little voltage is present. enough to light the diode.

davewalinski <lakeside@...> wrote: I have a TS-830S that the both LED lights on the RIT and the LED on the RF attenuator are lit all the time
reguardless of weather the RIT or RF Attn. switches are actually on or
not.
The radio otherwise works great. Also the led's are a slight bit dimmer
with switches off then reach regular brilliance with switchs on.
Any one else have this problem? Thank you.

Some of these jerks you mentioned are also pretty territorial, so I wonder how many of them will really move, with the phone band expansion. After all, as far as they're concerned, it's "their frequency", and they are the defacto owners. The funny thing is, commoeciual interests pay millions of dollars for HF channels. I didn't see these idiots paying money buy "their freq."

I can remember getting into a big roundtable on 75 meters on a summer afternoon in 1987, right after I graduated from the Univ. of Wisconsin. We had 9 people in it by 5 PM, and i had been going strong for at least 2 hours. Then 2 or 3 bozos broke in, and said that we were on their freq. They were not a net, but claimend that they had always ragchewed on it for the past 25 years or so, starting at 5pm. They could have moved up a few kHz (the band was still pretty uncrowded t that time of the day), but refused to. So like the big babies they were, they QRMed us, until we finally had to call it quits. This was in the General Class portion of the 75m phone band.

Thnks Ron. I did it over 20 years ago. the pages are what yellowed. That book has been coast to coast with me and helped me with so many antennas and learning concepts I couldn't tell of the nights I spent studying it. It's still one of my #1 reading materials.

I may have parted with all my magazines and textbooks over time and lost my old handbooks, but that antenna book is tight in my possession.

And thanks for the info on SM-220 hook-up. I've more than once thought of someday getting a station monitor. Time and money. But I'll plug along till I get there. Right now I got winter projects lined up. Be starting them soon.

Well to be honest with you unless I have food neither the cat nor the dog like me till they itch, have food or gotta get past a door.

But I digress that somehow I don't need to have them right there all the time under foot. But the food and water are in the kitchen and the book is in the bookshelf no where near the food stash.

The cat might sleep on my head and the dog down my back, but neither will have my book while I read or after I fall to sleep. Tho I must admit, that book has hit me in the face to many times and woke me up across the years now that you mention it.

What can I say antennas is a great subject. I'd rather get hit with the falling book than the falling antenna. hi hi...

I'll go 75 phone. 9 land on 40's a breeze. 80 should be a go too. I hadn't heard Dec 15th officially. I calculated it to be about right. Did they anounce that yet as being the official date?

Ellen R <ellenjoanne2003@...> wrote: Hi everybody,

As Walt mentioned, him and I own the Kenwood QSO group. We are at the bottom of the solar cycle. As a result of this, even 40 is long by 7 PM (not to mention, having horrendous BCI at night). BUT, 75m/80m has been doing better. I belong to a Hellschreiber group (the Feld Hell Club), and run their 80m net on Tuesday nights. Last night, using just 80W from my rig (a Yaesu FT-897D - sorry, I reserve Ms. TS-820 for relaxed SSB & CW QSOs) I ahd check-ins from coast-to coast on 3587 kHz. I think it may be worth it to try a Kenwood net on 75m. In the past, this would have been tatamount to comitting RF suicide, with all of the activity on 75. But with the Omnibus ruling taking effect on Dec. 15, the phone band will be opening up quite a bit. Extras like will be able to work all the way down to 3600 kHz. Advanced Class licensees will be able to work down to 3700 kHz, and Generals will be able to work down to 3800 kHz.

Could you all provide me with some feedback? Do you think that a 75m Kenwood net would be doable? If so, what frequency or frequencies do you recommend (especially since I'm not that familiar with the nets on 75). In my personal opinion, somewhere around 3805 kHz might be good, to include all members in the net who are General Class or higher. Please give me some feedback.

73,
Ellen - AF9J

P.S. - BTW, I'm eveng ame to try a net on 160m, I made some antenna revisiis recently that have really improved my low band signal.

Ellen after Dec15th there will be a change on those bands and the parties will resettle no matter what. Some will stay the same and some will move. That will show itself in time.

If you want to try 160 I can get 3 to 1 SWR on the 40 quarterwave. Not great but it is do-able. I must run barefoot since the linear will not go below 80. That's just the way it's built.

I can add some wire off the top horizontally to bring it closer to 160 resonance if I hinge it down and add a hose clamp.

The end fed is 160 quarterwave at 20 feet. But it only seems to land signals into New England and Eastern Canada.

My other linear for 160 isn't finished yet.

But I'll give it a try. Keep workin on it.

Ellen R <ellenjoanne2003@...> wrote:
OK, around 3805 is out. Where could we hold it above 3900? Any
ideas from those of you who know what the net situation is between
3900 & 4000 kHz. I'd love to do one on 160 (I've liked that band
since the mid 80s, when I was a new General class licensee, using the
University of Wisconsin's club station), if I have enough people
inetersted in it. I'll try a test net on 160. My only concern about
160, is that many hams will have a hard time getting anything to
radiate OK on 160 (I just got lucky in that regard). So, it would
not be a good choice for the main net. A net on 160 would be more of
a "doing it for a laugh" net. I guess, I'm hoping that the DX
Window, and some of the nets below 3850 would move down lower in
freq. after Dec. 15. It sounds like this won't be the case.

73,
Ellen - AF9J

I guess she wanted to monitor that frequency.

11276. Info on Kenwood TW-4100A

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-30 03:20:38 UTC
From: Bill Scurlock
Topic: 11276 Message: 11276

Can anyone tell me where to obtain information on the old Kenwood TW-4100A dualband radio? There is nothing on the Kenwood site or BAMA.

Thanks.

73, Bill, K5GCW

I have to ask, John. It wasn't an eight-legged surprise, was it?

I always remember as a child, every time my father pulled the chassis out of
our 6-tube/valve floor-standing radio, there was a mouse that had managed to
fry itself on some part of the HT wiring.

Hi Ellen.

I think 75M would work fine to either get together and talk, or have a net. Some experimentation would be a good thing to prevent frustration for our membership - as far a setting times and frequencies. With all the frequency changes taking place, there are lots of discussions I hear about nets moving, etc. to accomodate all the different classes of licenses. The DX Window (3790 - 3800) should be avoided, as well as any known nets, and the AM frequencies. However, some of these current utilizations could be changing soon. Why don't some of us, scattered around the country, try some QSO's every hour or so in the early evenings to see how the propagation would work for us. The frequency would need to be flexible until a "spot" could be found. If you set something up, there are probably several of us who would try to experiment with you.

There are probably some operators who do not have 75M capability, so this would not work for them.

Art, WB4MNK, and I have been talking once a week on 20M for several months with fairly good success. Gordon, N6WK, talked to Art one week when I was not there. We try to get together on Thursdays at 11:00 AM central time on about 14.215 plus or minus a "hole". For people who are still working, this time won't be practical. So there is a good incentive for an evening net. Plus, more people would be able to hear each other on the lower frequencies.

73, Bill, K5GCW

Subject: [TS-520_820_530_830] Re: KenwoodQSO Yahoo group - a proposed idea for a net

Hi everybody,

As Walt mentioned, him and I own the Kenwood QSO group. We are at
the bottom of the solar cycle. As a result of this, even 40 is long
by 7 PM (not to mention, having horrendous BCI at night). BUT,
75m/80m has been doing better. I belong to a Hellschreiber group
(the Feld Hell Club), and run their 80m net on Tuesday nights. Last
night, using just 80W from my rig (a Yaesu FT-897D - sorry, I reserve
Ms. TS-820 for relaxed SSB & CW QSOs) I ahd check-ins from coast-to
coast on 3587 kHz. I think it may be worth it to try a Kenwood net
on 75m. In the past, this would have been tatamount to comitting RF
suicide, with all of the activity on 75. But with the Omnibus ruling
taking effect on Dec. 15, the phone band will be opening up quite a
bit. Extras like will be able to work all the way down to 3600 kHz.
Advanced Class licensees will be able to work down to 3700 kHz, and
Generals will be able to work down to 3800 kHz.

Could you all provide me with some feedback? Do you think that a 75m Kenwood net would be doable? If so, what frequency or frequencies do you recommend (especially since I'm not that familiar with the nets on 75). In my personal opinion, somewhere around 3805 kHz might be good, to include all members in the net who are General Class or higher. Please give me some feedback.

73,
Ellen - AF9J

P.S. - BTW, I'm eveng ame to try a net on 160m, I made some antenna revisiis recently that have really improved my low band signal.

That's a good idea Bill,

I'll have to do some listening on 75, to determine what freqs. will work out. I'll announce on Kenwood QSO that I'm lloking for QSOs, and/or roundtables for trying out freqs.

73,
Ellen - AF9J

11283. Need Logging Program...

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-30 21:33:01 UTC
From: Steve
Topic: 11283 Message: 11283

I need a recommendation for a simple-to-use Logging Program. I am returning to radio after a five-year absence, and use mostly vintage gear, and a laptop.

I used to use LOG-E-Q-F, but have lost my files, so must now transfer many paper logs/QSL cards to new program.

Many thanks,

Steve in Maine

IIRC Set the freq and offset into the vfo. Press and hold the "M" key
till it beeps and then chose the location using the vfo knob. Press
"M" again and it's there. Press "M" briefly to go to the memories.

Oh, I was thinking TW4000, it is a 45w/35w radio.

My favorite that I've been using for some time is Aclog 3.0 from N3FJP. It is plain and simple, yet tracks awards and works well with LOTW and eQSL. It is inexpensive. The support is great. His website is http://n3fjp.com - check it out.

A good free one is Ham Radio Deluxe. Not quite as simple - it does quite a bit of rig control stuff in addition to logging. It is here: http://hrd.ham-radio.ch/

Hopefully this helps.

N3FJP's Amateur Contact Log 2.7 (or whatever the latest verson is). I really like it, & used it effectively dusing CQWW just past. It's easy, intuitive and editable. Tracks various awards, prints mailing labels, etc.

Try DXKeeper from DXLabs. I have used this logger for five years and works like a champ. Also FREE. It also comes with the best support out there.

Steve I got LOTW and I pipe in my log results form a compatible software. I got winlog 32 and am trying that out for now. I wound up in the same boat as you. Just starting e-logging.

There are a number of applications offered. That's just what I ventured into so far. It's all available on downloads off the web too. I also have eqsl.

no that was in the deep fryer in the garage over the winter.

No the back of my 830's seem to collect lint, fir and hair right around the switches. Right behind the face panels. You think it had been left above the dryer for storage by the way it got caked in there.

No I've since moved the station to an outbuilding thats away from the noise so I can listen to weaker signals. That got me away from the pet danders too. That's why I warned you about cleaning behind the panel. well that and to give you a laugh. But it is true. So look into it. Insulation belongs to the walls and the heat from the linear.

I'm betting with Geoff that it is a transformer. Looks like it has 3 windings.
My guess that it is a toroidal. Guessing one of two uses. A power transformer for a switching supply circuit of some kind of an audio transformer. This is just a very wild guess.

If you have an audio generator, feed an audio signal into one of the windings and compare the voltage peaks on the other two windings. Do this feeding all 3 windings one at a time looking for substantial differences.. This will give you an idea if it is a 1:1 ratio or a different ratio.

Next send audio signals through it from 10 Hz to the upper limit of your generator and observe the output on the scope. See what it's frequency range is.

BTW, nice job on the restoration of the Heathkit and power supply.

Geoff
I have added a 3rd pic of the back side showing the numbering on the leads. Ohmeter indicates 0.1 ohm as follows with all other permutations as open:
lead 1-2
lead 3-4
lead 5-6
Same measurements when polarity is reversed.
thanks for the help
Barry

Walt.

Thanks for the very interesting parts site info. It was a real lesson in economics. I'm going to go to the barn, move all my old parts into better storage conditions, and start treating them with TLC. Glad I've been hanging onto "stuff" for the last 45+ years.

Steve,
Welcome back!!
2 years ago I came back after a 8 year absence, after doing some looking for a logging program I choose DX Keeper, part of the DXLabs Suite of programs. Its a free program with lots of user support, and a Yahoo mailing list reflector.. this program is constantly being worked on and improved based on users input.

You can find all the info here:
http://www.dxlabsuite.com/

Topic: 11307 Message: 11307

Hi All,

Slowly getting there, found that I only have 400v on the HT (HV) line, so there is a low voltage.
Have checked the diodes and the caps, and these all look okay, so probing deeper.

Could someone please tell me what the markings on the transformer are, the service manual does not note them. The input side is fine, it marks the voltage lines okay, but the secondary side is as follows

R1
R2
E1
E2
B1
BCT (B Centre Tap)
B2
C1
CCT (C Centre Tap)
C2

I can probe the terminals, but if someone could give me the correct readings, I can then check them against it.

My TS-830 is a 240 volt model, for New Zealand.

Regards

Kevin, ZL1KFM.

Subject: Re: [TS-520_820_530_830] New to Group - No Power Output

Kevin:
I doubt that it is the tubes. With your meter switch on HV what is your high voltage?

It should be in the area of 800 V. If it is low like 400 V you have bad High voltage filter capacitors C-22 and c-24 or a bad diode, D1,D2,D3,D4.

If the high voltage reads correctly, take the cover off of the rig and measure the voltage at the point labeled SG on the bottom of the final board. It should read a bit over 200 VDC.

Use caution around the rectifier board, the capacitors, and the transformer as well as inside of the final unit. There is 800 Volts there.

Does the rig get a normal ALC reading with the meter switch on ALC when tuning up and peaking the drive control ?

Let us know the results from the above.

Vy 73, Walt N9WB

Subject: [TS-520_820_530_830] New to Group - No Power Output

Hi All,

Thanks to allowing me join this group.

As a owner of a TS-830, I am glad to be able to find this group, and hopefully help with advice, and also receive.

Today, I am in the need of help.

My TS-830, in my care for 5 years, has decided in the past few days to stop transmitting. The last activity was the CQWW contest a few weeks back. The next time I tried using it, I got very little, to no power output. Now I get nothing, bias has even dropped to nothing, well only about 5-10ma, it had been sitting steady on 60ma, as the manual mentions without any problem.

I am guessing the tubes have died, and will need replacing?
I know they are 6146B's, and have checked on eBay and found 6146W's.
What are the differnce between these type? I did hear that the "B" are better?

One comment I received during the contest, was that he could hear a buzz on the TX. Might of been the start of it's death. :(

Any help of any sort would be grateful, wish to get the radio back working, and operating.

Regards
Kevin, ZL1KFM

They're still around. You see them for sale once in a while. I just chose carefully my post.

I'm setting up my staion accessories for my TS-830 layoutand it would add a nice touch. I build one oiece at a time. I've been on 830's since the early 1980's. It was my first bought brand new radio and the finacing was a major expense. I still wouldn't trade it.

My outlay has 830 and the SP-230 matching speaker and MC-50 mic .I have the VFO 230 so far. that's the one with the digital display and 5 memories.

I've recently aquired a couple of TV-502 Transverters, which should be ready by the end of winter. I still search for the 6 meter unit as well.

Now I do have some other station stuff that's not vintage but can keep the staion going, but my aim is vintage as much as possible. It's a dream I've had for years.

I'm just grabbing it up before you can't get it anymore.

I have not heard of this replacement you speak of per say, but I wouldn't be suprised since I've seen similar mods done on other vintage radios.

I agree John. I'm on my second 830, but this time I have the matching tuner, speaker and digital VFO. I owned an SM-220 scope a while back but traded it away. Not that I need one, but it would be nice to have the piece for the collection. They are just so darned expensive. Same for the TL-922 amp. Would be nice to have but not sure I could afford the electricity to use it!

I'll keep my eyes out for the clock.

Hi Kevin

When you say that the caps are OK, have you actually measured the capacitance of both in the HV supply? If one cap is open or low in capacity, it will mean that one side of the voltage doubler won't work and this will give you around the 400v that you are geting.

Apologies if you have already considered this, but 50% HV is uaually a capacitor or diode problem, as Walt pointed out.

One of the large filter caps in the middle of the radio is open.
Measure the voltage across each one. It should be around 450 volts. Do
not measure to ground, measure plus to minus on each cap. One will
read close to zero.

BE CAREFUL IT CAN KILL YOU

Clif

To Geoff and Cliff,

Thanks for the input, I had checked the caps, but not as you both described, was measuring to earth (ground).
I have now gone back and checked them, and believe they have both gone(maybe), as neither are showing anywhere near 400v. One is reading 95v and the other 118v. Will look at replacements.
I was checking the input to the rectifier board at AC800, and was only getting 335vAC, so thought the transformer might of gone. Looking in the wrong place. (again) Output at 800 was 540v

Topic: 11299 Message: 11316

Thanks. I wanted the TL-922 but I just can't afford it right now. So I took one of my other amps an FL-2100B and got it connected. It works rater well. I can't QRO on 160, but I have all I need on 80 thru 10. I have another I will put on 160 thats a SB-220 clone. I want to change the 4-400's out and add the extra upgrading to make it 3-500Z. I already have new tubes. So up the Power Supply and add the extra grid circuitry. Drop the band switch and just set it up for 160.

Be nice to get SM-220 with BS-8 pan display. But again that's someday down the road. My shack will look something like out of the 20th century. Astatic D-104 I already have along with MC-50 and I will someday get a more original straight key and a bug. I've often thought about RTTY too.

For now getting transverters is a big step. Got 2 and need 6 meters. Making the cable is a project that I'm enjoying the challenge of including making my own connectors.

The immediate work is getting the heat working again. Got some of it last night. Started making a power control using the ALC line. I need to reduce power for driving the linears and QRP power for the transverters.

A few more wall panels I painted but didn't get up yet and about half the roof is insulated now. The doors I'll do to.

I have started solar power on a small scale. So alot is going on right now. Much of the materials I already have and been getting as I can.

A little at a time. Back to you.

>

> I'm just grabbing it up before you can't get it anymore.

I agree John. I'm on my second 830, but this time I have the matching
tuner, speaker and digital VFO. I owned an SM-220 scope a while back
but traded it away. Not that I need one, but it would be nice to have
the piece for the collection. They are just so darned expensive. Same
for the TL-922 amp. Would be nice to have but not sure I could afford
the electricity to use it!

I'll keep my eyes out for the clock.

11317. 2X Capacitors Wanted

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-04 23:51:13 UTC
From: Kevin & Natalia
Topic: 11317 Message: 11317

Hi All,

I have pulled my 2 large capacitors from my TS-830, for the voltage doubler. Both have failed.
I am now in need to obtain a couple of replacements. However they are not available here in NZ (ZL Land), and will need to source from over-seas.

My questions, is there a source of these available, direct replacement?
If so, could I please grab the address, so I can order them.

FWIW, these are the 100uF, 500v ones, mounted in the middle of the rig.

Regards

Kevin, ZL1KFM.

Kenwood USA ran out about 6-7 years ago. I buy them from Digikey but they are not the same size. I don't know where to tell you "down under"

Topic: 11317 Message: 11320

Hi Kevin

RS Components in Australia appear to have 100uf 500v caps. Go to:

http://www.rsaustralia.com/cgi-bin/bv/rswww/home.do?returningUser=N&cacheID=auie

and search for "capacitor 100uf 500v" and you should see two possible units.
I have never used them myself, but it looks as though you can order by phone
or online - and they seem very reasonably priced (about AU$8-10). You may
find that they are a different physical size from the originals, but as long
as they're close, that's not a big problem.

There may even be a similar outfit in NZ if you do a search on the internet.

Out of interest, why do you think the caps are the problem? Do they look
lumpy/leaky? What do you see with an ohmeter across the terminals? - BE VERY
CAREFUL that they are fully discharged and disconnect the wiring from at
least one side of the cap before applying an ohmeter.

Regards
Geoff VK2HQA

Hi Kevin

Yes I'm sure there would be no problem going up in capacitance within reason
(150uf would be fine), but don't go below 100uf of course.

I think that 450 volt units have been used with no problems too - though
others may correct me on that.

I have 150uF's in my TS-520SE with no problem. I bought them from
digikey and they fit the clamps just fine. I can dig for the part
number if you need it.

As long as they are both 150 and the voltage is the same or higher, they will work fine. The next question is will they fit? Probably so because today's capacitors are physically smaller than the ones of years ago. The increased capacitance will stiffen up the high voltage regulation a bit and lower the hum a few more dB.

I would try to keep them 500 volts if possible. 450's may hang in there, but it is a degrade and brings the rated value dangerously close to the operating value.

Hi Kevin

Yes I'm sure there would be no problem going up in capacitance within reason (150uf would be fine), but don't go below 100uf of course.

I think that 450 volt units have been used with no problems too - though others may correct me on that.

>Walt sorry for the time lapse, I am very buisy at work now.
You were correct about losing bias.
Q5 shorted
D-7 open
R-38 (rf board) shorted (burned).
No voltage at any of the points.

Thank you very much, I will get the parts and when I have the time
I will replace them and see if I get voltage where I should.

73 Jim af4at....

> The control grid of your finals requires a negative voltage to keep
it from drawing excessive current. If it does not have this "Bias"
voltage, the tubes will burn up and damage the cathode resistors R2
and R3. When transmitting, this negative voltage is reduced to allow
the tube to draw 60 MA of cathode (plate) current. I suspect that you
have lost this bias voltage.
>
> First, remove the tubes. Position the plate caps so they do not get
into mischief. Next remove Q5 from the RF board. This is a 2sc1515.
Check it with your ohm meter.
>
> To do this position the flat side with the beveled top toward you
and have the legs pointing down. The right lead is the base. The
center lead is the base. The left leg is the emitter.
>
> Place the black ohm meter lead on the base and the red meter lead
on the collector. It will either read a high or low reading.
> Now reverse the leads and do the same thing. It should read high
with the leads one way and low with the leads the other way.

Walt,

Are you saying then, that one could go larger, if space allowed the fitting of the capacitor?
The larger the capacitor, the more filtering it would do, thus be a cleaner regulation?

With your information, I am going to get at least the 150uF, 500v items in the next few days, give the radio a Christmas present.

Thanks for yours and everyone's else's input, it has been a great help. Only hoping that this cures the problem, and gets me back on air with it.

Regards

Kevin, ZL1KFM.

As long as they are both 150 and the voltage is the same or higher, they will work fine. The next question is will they fit? Probably so because today's capacitors are physically smaller than the ones of years ago. The increased capacitance will stiffen up the high voltage regulation a bit and lower the hum a few more dB.

Topic: 11322 Message: 11330

Kevin:

Yes, going to higher uf will improve the filtering, and higher voltage will make it more rugged.

Now I don't recommend increasing the uf rating to an outrageous amount such as 400 uf because you can run into issues of increased in rush current surges wiping the diodes, the fuse, or the transformer when the rig is turned on.

But 150 uf at 500v will make a VERY suitable replacement choice.

While you are ordering parts, You may want to consider some other checks and replacements. While this is not absolutely necessary, the components I am mentioning below often weaken with age.

On the rectifier board:

You may wish to replace D-1 through D-11 on the rectifier board. Any general silicon diode rated at 1000 V and 1 amp will do. Some of the ones used on the lower voltage areas are now lower than 1000 V but this was done for cost. The 1000 V 1 amp types will do fine for these replacements.

I found some 1 amp 2000 V diodes that had the same leads as the originals and used them in my TS-820. These are even better. While this will not increase performance, it reduces the chance of failure. I am recommending the diodes be replaced because of age.

Also check R- 1,2,3 and 4. If you replace them use original ohms value and original 1/2 watt.

Also check R-8 as well as R-11, 12, and 13 with an ohm meter and replace them if they are more than 15 % off..

Observe the other resistors on this board and replace any that are bubbled, cracked or look fried.

On the final unit board, there are 4 resistors, R3, R4, R5, and R6. These are 20 ohm each. They are 1/2 watt. Observe these for cracks or serious bubbles. With an ohm meter, check across any one of them. This will check the total parallel value of them. This can be done in circuit. It should read very close to 5 ohms, the total value of these parallel resistors. If they look bad or check more than 6 ohms, replace them. How close to 5 ohms you expect to see depends on the accuracy of the ohm meter. Use the original 1/2 watt. Do not increase the wattage value of these. These act as a fuse if a final shorts and prevents more extensive damage.

Again, this is not mandatory, I am sure the new capacitors will solve your immediate problem. However, these are things I check when I am working on one.

I am assuming that this is a TS-830. If not, tell me which rig and I will change the above instructions.

One way that I do it is to heat the center conductor with my soldering iron. Holding it close but not touching. When it gets soft take your strippers and off it comes. Good luck!

My trick is to use an exacto knife thats not to sharp and heat it in an open flame. It melts tru the insulation to the center element after you remove the shield. I found it as a technique after using thermal strippers for the exact same application to use for coax. Thermal Strippers work a little better, but I can't afford another pair. This is how I substiute, as it strips the insulation with heat without knicking the conductor elements.

A bandswitch will be difficult to find. Why do you need a new bandswitch? The reason that I am asking is that most of the common problems with them are repairable. If the connection on the wafers are intermittent and spraying them with De-oxit will not fix them, I will tell you what to try.

Hi Steve.

A bandswitch problem is not unusual. The first thing to try is using DeOxit on all the contacts and rotating the bandswitch several times to try and clean the contacts. Sometimes this cures the problem. Another common problem with the bandswitch is the way the switch contacts are riveted to the PC boards. Over time these develop poor contact continuity and need to be repaired by either soldering them, or using a conductive liquid to make good contact. Another common issue is the shaft coupling into the final tube compartment develops cracks in the area of the tightning screws and does not firmly control the switch section inside the final tube compartment. There are replacements for these shaft couplers available from K4EAA - see his website.

Many of the problems that show up on these radios relate to intermittant or poor contact connections on all pots, connectors, switches, etc,. and DeOxit is the best thing to try first. Most of the people on this reflector have been down these "roads", and will be glad to try to help you resolve your problem. They certainly have helped me for the past year or so.

To my knowledge, replacement switch wafers for the bandswitch are not available new. If I'm wrong, someone please correct this statement for Steve. Removing and replacing the switch wafers is no simple task, but is certainly feasible if you keep all the parts in their proper order, and know how to desolder and solder connections to a PC board.

Why don't you tell the "group" some of the details of your symptoms, and see what kind of responses you get back. Good luck.

In the FWIW department, I keep one in stock for those that just can't be fixed. Also for the firstimers removing the bandswitch is not that hard. There is a trap door under the RF unit that allows access to the back of the RF unit without having to remove it which is a pain. Think, remove the screws from the AF board and tilt it over, Viola, trap door.

11341. Help with TS-830

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-08 13:15:52 UTC
From: n8ie@woh.rr.com
Topic: 11334 Message: 11341

My beloved TS-830 is sick and needs help.

Last fall I tuned her up on 160 LSB and had a nice QSO with a local Ham.
A few days later I made a few CW Q's and a USB Q on 20M, all was fine.

I then went to chase some DX on 80M and found that when I switch to LSB,
the RX and the display goes out.

I opened her up and found no obvious things wrong, like broke wires or
burnt parts.

Any suggestions?

Dan, have you tried cleaning the USB/LSB switch? Did
it only happen on 80 meters? How about the other
bands? Does it still work on USB and CW?

I live in Centerville, so maybe sometime two heads
could be put together?

My TS-830 is going to get the once-over this winter.
I'll be installing the diode mod and cleaning everything
I can get my hands (and de-oxit) on.

I notice that you also have a TS-570. So do I. I still,
however, like the audio from the TS-830 better for some
reason.

Regards,
Ken W8ASA

Need to buy a cw filter for my 830s, for the CW.N slot. I was thinking around 500Hz...

Should I get it from International Radio?

Which of their filters could someone recommend?

Many thanks,

Steve in Maine

That's the same Part Number for the TS-530. Amazing, a manufacturer who doesn't confuse the issue.

As an ex-service engineer I found one of the most useful piece of information I had was the list of equivalents between so called competitors, who obviously bought from the same suppliers. Or, who were probably the real owners!

Also interesting was the price charged for identical spares, depending on whether it was for a 'popular' or a 'quality' set.

Yes. It doesn't match the unit cosmetically! :) Otherwise it shouldn't be
any different than using any other brand tuner.

Hello Ken,
I have not tried using de-oxit yet, will give that a try.
I know some of the contacts are dirty and that would be a great place to start.

LSB is dead on all bands, USB and CW work great.

Cool on Centerville, good to know another local 830 owner. I know another local Ham who has the entire 830 sans the monitor scope. God what a nice looking setup!

My 570 is a work horse. I use it for contesting and so far except for the internal tuner breaking, it's been pretty much bulletproof. But the 830 is a pleasure to listen to and is hands down my favorite rig.

Where locally can I get de-oxit it, or that a generic term?

Dan,

If LSB is dead on all bands but USB and CW are working, I doubt very much it is the bandswitch. It could still probably use a good cleaning anywhere, but I'll bet your problem is with an oscilator somewhere. I also have the complete line except for the scope. Had an SM220 years ago but traded it away. Wish I hadn't now.

And harder to find than a bandswitch. Need a dead 830 for that. When I got mine I noticed the mode switch was loose. Tightening the nut on the shaft on the chasis it snapped right in two. I suspect the ham I got it from knew this and that's why it was loose. I bought some JB Weld and rebuit the shaft and it has worked great ever since.

Yes max,
They are hard to find. There was a fellow over on Eham or QTH that
was parting out an 830 a couple of weeks ago.
It sounds like you got lucky in repairing the shaft on yours. Good Job
though!

I would like to get another 830 for parts. The JB Weld goes on like liquid metal and when it hardens you can actually drill through it. I applied some to the shaft on the front and rear of the chasis and it has held with no problems. It bonds any kind of material together. My latest project at hand is trying to get some light behind the meter in the AT230 tuner. I keep the shack dim and it gets hard to see.

I have almost a complete 830 line. I have the SM-220,
the VFO-230, and the SP-230 to go with the
transceiver. It looked really nice, and my XYL even
commented on it, but I recently added the TS570 and
a Power Supply which sit on top of everything and
look a little helter-skelter, so I need to move
things around a little.

11357. Reasonable price for 830s in good or great shape?

I'm currently working on my morse code for a future upgrade to General class. I've seen some reviews on the 830s and some mighty fine pictures, too. So, what is a reasonable price for an 830s in good-great shape, cosmetically and functionally? I hear they can go for upwards of $400 or so. Is that kinda high? Or are they enough of a collector's item that they can command higher prices?

Jody,
I would expect to pay Over $400.00 for a nice condition TS-830 that
has been cleaned and Aligned with full output.
There are bargins out there however.
I might suggest you use caution if buying one off ebay.
One of the favorite lines on ebay is " I picked this up at an estate
sale and have NO way of testing it"
To me that says "DANGER>>>DANGER>> It probably doesn't work !! "

Jody,

I've seen them go anywhere from $300-650 depending on condition, extra filters in the radio etc. Even though the 830's are 25+ years old they are still highly sought after transceivers. Very few of the modern DSP rigs can come close to the receiver specs on the 830. And the cleanliness of the transmit audio is well known. Truly one of the better radios to be marketed. With that being said, there are some troublesome spots as well. Probably the most common is intermittent loss of transmit or receive on some or all bands. This is due to the contacts on the bandswitch failing. It can be fixed, but best to stay away unless you are comfortable with that kind of repair. Another issue is the shaft couplings cracking, but brass replacements are available. Aside from these issues and the general upkeep of components that are this old, the 830 is a great radio and I'm sure they will hold their own for years to come. I have the 830 with the matching tuner, speaker and digital VFO and enjoy each and everytime I operate. To answer your question about being collectors items, to those that own them the answer is YES!

Hi All,

I have a very nice 830S for sale. Completely gone through and aligned. Replaced the stock band switch coupler with a brass one from K4EAA and have done the diode upgrades. It is one of the ones I used to run Spectrum Analyzer plots when we were doing the Shottky checks. No issues. In fact it looks new. Has the newer YK-88S1 2.7khz SSB filter. E-mail me direct if interested.

Hi,

I know I have not made the full month yet, but hoping the mediators will allow this through.

I am looking for the following two items, preferably from New Zealand or Australia (exchange rates)

1. VFO-230 - External VFO with memories.

2. ATU-230 - Antenna Tuner.

Would like to get the speaker as well, if there is one around, but not a urgent purchase.

If there are any available, please direct information, and price wanted directly, not through the group.

Thanks

Kevin, ZL1KFM.

Dan.

Gordon is probably correct about the Mode Switch. Switch section S18-1 controls 9v going to the PLL unit. In USB, the 9v is supposed to go to Connector 8 Pin 5 to activate the USB oscillator. Something is probably wrong somewhere in this circuit. It could be the switch, or in the wiring, or in the connector going to the PLL unit.

If you have the test equipment and access to schematic information, Service Manual, etc., check the voltage from Connector 8 Pin 4 on the PLL unit when the Mode Switch is in LSB position, and then switch to USB and check Connector 8 Pin 5 to see if the same 9v signal is making it to the PLL unit for the USB oscillator.

A frequency counter connected to TP3 on the IF unit can also check to see if the 8831.5 KHz signal is present when in USB mode. In LSB, this frequency should be 8828.5 KHz.

Good Hunting.

11368. My "new" TS-830S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-09 14:23:33 UTC
From: Tim Boppre
Topic: 11368 Message: 11368

Hello to the group:

My "new" TS-830S arrived yesterday. It is GREAT!!! I've been dreaming of one of these radios since I was a kid and finally decided to get one. Got it on the air late yesterday afternoon and worked a couple of people on 20M phone. Brings back a lot of memories of listening to that wonderful Kenwood audio as a kid. It's also wonderful to have a radio with knobs!!! The Kenwood folks got the interfaces of their rigs just right. It is a pleasure to operate.

So far all is well with only one slight problem. It has a slight frequency drift of about 100-200Hz. Looking in the TS-830 Survival Guide it appears to be related to the FIX switch as when I wiggle the switch the freq. display bobbles a bit. I'll get after that today with some De-oxit and see if that resolves the problem.

I've been reading this list for a while and joined the group several weeks ago. I've been very impressed with the quality of questions and most important the quality of the responses. I look forward to learning a lot more about these radios by reading this list and finally having one to operate.

73,

Tim

Look into thunderchicken_01. The posting went up recently and it may still be available. I think it went for 325 when I saw the posting. That's a good price for an 830.

Ones in good shape generally bring 350 to 450 dollars (US). I've seen them higher, but the condition generally is the reason they will sell at that price.

Sometimes someone doesn't know what they have and will sell it for cheaper. Generally you watch for a while and compare you'll find them a little cheaper. That mode sometimes takes a while.

Hi Walt

It was me, John Harp KA3DPW. I posted for an HC-10 clock upon December 4th. I was looking for the matching clock to the TS Line.

I originally saw it in the TS-830 manual as accessory. Decided to post by the rules newly eatablished to the group. This is an item not normally seen easily. So I posted in case someone just happens to see one.

It's an item I can afford at this time for the 830 outlay that should require little effort to get going an place in the station.

I build one piece at a time. If you or someone finds one I got the cash and some help getting it would be appreciated. Thanks. John.

There are Amateurs who restore these rigs and then sell them. They have a good established reputation. If problems develop, they will stand behind the products that they restore and sell. It is worth a extra couple of hundred dollars to purchase from them and be assured that you will not be stuck with a pig in a poke that will cost you $300.00 and hassles to get it operating.

If you are capable of restoring basket cases, then buy from sources such as E-bay, but pay only parts prices. If you want a rig that is ready to go, expect to pay more and buy from a reputable restorer, and pay a bit more.

Dan,

First question, since I'm not familiar with your radio. When have you cleaned the radio last?

Second, go in and clean the mode switch with some kind of tuner cleaner or contact cleaner that leaves no residue. Spray into the switsh and rotate the contacts if you can.

Third, look at the wires attached to the switch at the joints. Look at them with a magnifying glass to see the joints are good. Then follow each of them back to where they came from. Check to make sure they are connected real good and solid. If they are a connector pin then pull the connector from the board and spray the connections and put them back on the exact same way they came off. Do it several times to remove anything still on the contact.

I've gone thru this process before and eliminated problems in the past on my TS-830's. Some times cleaning a ground by backing it out cleaning it and retighening it will resolve the issue.

Those front face panels collect hair and lint in there and you can't see it easily sometimes. Remember these radios have been around for years. They collect deposits in thier contacts over time.

Try this first to eliminate it, see if it helps. It may eliminate the issue cheaply and effectively. If not then you've elimeinated the obvious first.

n8ie@... wrote:
My beloved TS-830 is sick and needs help.

Last fall I tuned her up on 160 LSB and had a nice QSO with a local Ham.
A few days later I made a few CW Q's and a USB Q on 20M, all was fine.

I then went to chase some DX on 80M and found that when I switch to LSB,
the RX and the display goes out.

I opened her up and found no obvious things wrong, like broke wires or
burnt parts.

Any suggestions?

Yes and take a look at K4EAA's website about cleaning those band-switches. Very good insight from a repair person who does them alot. He shows good pictures and introduces the tools and way he goes about restoring them.

Bill Scurlock <k5gcw@...> wrote: Hi Steve.

A bandswitch problem is not unusual. The first thing to try is using DeOxit on all the contacts and rotating the bandswitch several times to try and clean the contacts. Sometimes this cures the problem. Another common problem with the bandswitch is the way the switch contacts are riveted to the PC boards. Over time these develop poor contact continuity and need to be repaired by either soldering them, or using a conductive liquid to make good contact. Another common issue is the shaft coupling into the final tube compartment develops cracks in the area of the tightning screws and does not firmly control the switch section inside the final tube compartment. There are replacements for these shaft couplers available from K4EAA - see his website.

Many of the problems that show up on these radios relate to intermittant or poor contact connections on all pots, connectors, switches, etc,. and DeOxit is the best thing to try first. Most of the people on this reflector have been down these "roads", and will be glad to try to help you resolve your problem. They certainly have helped me for the past year or so.

To my knowledge, replacement switch wafers for the bandswitch are not available new. If I'm wrong, someone please correct this statement for Steve. Removing and replacing the switch wafers is no simple task, but is certainly feasible if you keep all the parts in their proper order, and know how to desolder and solder connections to a PC board.

Why don't you tell the "group" some of the details of your symptoms, and see what kind of responses you get back. Good luck.

First look at the owners manual for Kenwood TS-830S. There is an overview of what the combinations of filters will do for you as well the drawbacks.

I can't say yay or nay about International as I have not dealt with them for a filter. But the information I pointed out in the manual you may want to consider as it is pertinent to the performance of your 830.

From: Peter A Markavage
Topic: 11357 Message: 11376

I agree with Walt on this. Buy from someone who restores these rigs at least from a ham who has the rig and has upgraded to something newer and is looking for a home for his 830. If buying from a thunderchicken, or a tree-topper1278, etc., assume that you're probably buying a parts rig or a rig that probably was beat into the ground.

Pete, wa2cwa

On Sat, 9 Dec 2006 12:36:44 -0500 "n9wb" <n9wb@...> writes:
There are Amateurs who restore these rigs and then sell them. They have a good established reputation. If problems develop, they will stand behind the
products that they restore and sell. It is worth a extra couple of hundred
dollars to purchase from them and be assured that you will not be stuck with
a pig in a poke that will cost you $300.00 and hassles to get it operating.

If you are capable of restoring basket cases, then buy from sources such as
E-bay, but pay only parts prices. If you want a rig that is ready to go, expect to pay more and buy from a reputable restorer, and pay a bit more.

Subject: Re: [TS-520_820_530_830] Reasonable price for 830s in good or great
shape?

Look into thunderchicken_01. The posting went up recently and it may still
be available. I think it went for 325 when I saw the posting. That's a good
price for an 830.

Ones in good shape generally bring 350 to 450 dollars (US). I've seen them
higher, but the condition generally is the reason they will sell at that price.

Sometimes someone doesn't know what they have and will sell it for cheaper.
Generally you watch for a while and compare you'll find them a little cheaper. That mode sometimes takes a while.

Jody Mills <Jody.mills@...> wrote:
I'm currently working on my morse code for a future upgrade to General class. I've seen some reviews on the 830s and some mighty fine pictures, too. So, what is a reasonable price for an 830s in good-great shape, cosmetically and functionally? I hear they can go for upwards of $400 or so. Is that kinda high? Or are they enough of a collector's item that they can command higher prices?

From: Dave and Loraine
Topic: 11377 Message: 11377

Hi Art and all,
Just for reference:
I have a TS-820S un-modified with the original tubes.
On 80m, I see about 120W into a dummy load on my cheap power meter. SWR 1:1.
I did the power calculation P = Veff squared / dummy load resistance which resulted in 125w.
Vpeak = 125V. Veff = 88V. Dummy load = 62 ohms.
RF voltage was measured on a 'scope.
On the rig's meter, HT was 860V rx and 750V tx. Tx current was 240mA.
Either my calc is wrong or the original tubes are tough!
Good luck with the replacements.

I've put this on before, check all the screws holding the PCBs, they work loose and cause bad grounding. In fact check any screw that looks as if it could ground something. This was a tip given me by a Kenwood Engineer.

Subject: Re: [TS-520_820_530_830] Help with TS-830

Dan,

First question, since I'm not familiar with your radio. When have you cleaned the radio last?

Second, go in and clean the mode switch with some kind of tuner cleaner or contact cleaner that leaves no residue. Spray into the switsh and rotate the contacts if you can.

Third, look at the wires attached to the switch at the joints. Look at them with a magnifying glass to see the joints are good. Then follow each of them back to where they came from. Check to make sure they are connected real good and solid. If they are a connector pin then pull the connector from the board and spray the connections and put them back on the exact same way they came off. Do it several times to remove anything still on the contact.

I've gone thru this process before and eliminated problems in the past on my TS-830's. Some times cleaning a ground by backing it out cleaning it and retighening it will resolve the issue.

Those front face panels collect hair and lint in there and you can't see it easily sometimes. Remember these radios have been around for years. They collect deposits in thier contacts over time.

Try this first to eliminate it, see if it helps. It may eliminate the issue cheaply and effectively. If not then you've elimeinated the obvious first.

11379. 2X Capacitors Wanted/No Power Output - Fixed "THANKYOU!"

From: Kevin & Natalia
Topic: 11379 Message: 11379

To Everyone on the Group.

THANKYOU!

Please take it from me, that your help was very grateful.
I have just finished fitting the new filter caps in my TS-830S. Checked everything that had been advised to check and replace as required, and applied power.
Stood back just in case.
I now have the required voltage from the capacitors, and the HV meter is reading now too.
I was only able to obtain 100uF/450v capacitors at the time, but from Walts info I have sourced 150uF/500v capacitors which I will purchase, and replace the current replacements out.

I have output power reading on my Kenwood SW-200 meter, which is what I wanted.

My first attempt at working/fixing a valve radio, and it is very satisfying to repair it myself (with help), without having to send it in for repair.

Regards

Kevin, ZL1KFM.

Subject: Re: [TS-520_820_530_830] 2X Capacitors Wanted - Update Information.

Kevin:

Yes, going to higher uf will improve the filtering, and higher voltage will
make it more rugged.

Now I don't recommend increasing the uf rating to an outrageous amount such
as 400 uf because you can run into issues of increased in rush current
surges wiping the diodes, the fuse, or the transformer when the rig is
turned on.

But 150 uf at 500v will make a VERY suitable replacement choice.

While you are ordering parts, You may want to consider some other checks and
replacements. While this is not absolutely necessary, the components I am
mentioning below often weaken with age.

On the rectifier board:

You may wish to replace D-1 through D-11 on the rectifier board. Any general silicon diode rated at 1000 V and 1 amp will do. Some of the ones used on the lower voltage areas are now lower than 1000 V but this was done for cost. The 1000 V 1 amp types will do fine for these replacements.

I found some 1 amp 2000 V diodes that had the same leads as the originals and used them in my TS-820. These are even better. While this will not increase performance, it reduces the chance of failure. I am recommending the diodes be replaced because of age.

Also check R- 1,2,3 and 4. If you replace them use original ohms value and original 1/2 watt.

Also check R-8 as well as R-11, 12, and 13 with an ohm meter and replace them if they are more than 15 % off..

Observe the other resistors on this board and replace any that are bubbled, cracked or look fried.

On the final unit board, there are 4 resistors, R3, R4, R5, and R6. These are 20 ohm each. They are 1/2 watt. Observe these for cracks or serious bubbles. With an ohm meter, check across any one of them. This will check the total parallel value of them. This can be done in circuit. It should read very close to 5 ohms, the total value of these parallel resistors. If they look bad or check more than 6 ohms, replace them. How close to 5 ohms you expect to see depends on the accuracy of the ohm meter. Use the original 1/2 watt. Do not increase the wattage value of these. These act as a fuse if a final shorts and prevents more extensive damage.

Again, this is not mandatory, I am sure the new capacitors will solve your immediate problem. However, these are things I check when I am working on one.

I am assuming that this is a TS-830. If not, tell me which rig and I will change the above instructions.

Hi all. Hope you can point me in the right direction. My TS820S has an intermittant problem where the display will go blank for a second or so and the audio will drop out. The display returns to normal and the audio returns normally depending on the agc setting. Prior to this, my display would drop one digit (usually the khz (100's)) and return. I'm thinking I need to remove the display boards and clean all the contacts but what might be causing the entire display and audio to drop?

Thanks - Jack KF4YIO

Jack,

First thing I would do is remove. clean and reseat ALL connectors. I got an 820 once at a silent auction from our local club for $76 CDN. I was told there was no receive audio and the display didn't work. After removing all connectors, applying contact cleaner and tightening all screws the unit worked like new. I traded it for the Cushcraft R7 that now towers over my house.

I believe the problem is dirty contacts in the PLL and CAR assemblies that is causing the receiver to appear dead. The digital display going blank is most likely caused by dirty contacts on the top and bottom display assembly.

The audio going dead is a sign of failure in one of the following:

IF Assembly
PLL Assemblies
CAR Assemblies
RF AMP Assembly

Clean all the plugs, pins and internal pins on the CAR and PLL assemblies plus all plugs and pins on the IF and RF board. Of course don't forget to clean the digital display plugs (top and bottom) and relay too.

I chased down a problem to a dirty pin inside one of the multi connection plugs. Once I found it, cleaned it, made sure it was making good contact with the board pin, the 820 worked like a champ.

>Hi Jack,

In addition to the other, good suggestions, you may have to check and clean the VFO tuning capacitor shaft at the rear of the VFO. It can be
the cause of intermittant display/audio problems. I have used De-Oxit to clean and restore the VFO capacitor to reliable operation. There is
a PDF available on Gordon's web site http://www.n6wk.com/kenwood/TS-820-
VFO--servicing.pdf)that shows how to remove the VFO.

As for display problems, another area to service is the counter unit. First, clean the connectors at the top and bottom of the counter unit,
as well as the connector to the DG-1. Then,remove the counter unit from the '820, open the housing and separate the two circuit boards. Clean the pins on the Molex connectors with De-Oxit. Also, clean the foil area under the screw heads.

From: n9wb
Topic: 11381 Message: 11387

I would check the 9V regulator. this is on the AF/AVR board. VR-4 often becomes intermittent causing problems such as this.

Locate the plug AF1 on the AF/AVR board. Find the point on this plug labeled 9. Place a DC volt meter probe on the 9v regulator, the minus wire on chassis ground. Use an insulated tool and wiggle VR-4 and see if the voltage holds steady. VR-4 should be set for exactly 9VDC at 9.

If this does not appear the be the problem, monitor the voltage at 14 while the rig acts up. If it changes, look for intermittants in the 14 V source.

If VR-4 is bad, it can either be replaced with a 500 ohm pot like the original, or replaced with two fixed resistors that equal around 500 ohm and place the voltage exactly at 9V. In one case, I used a 470 ohm and a 120 ohm resistor as a substitute for the pot. When finished, the voltage MUST be exactly 9V.

Be sure all of the screws are tight on this and other boards.

11388. Re: CW filter...830s

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-11 08:01:14 UTC
From: Phil Hartwell
Topic: 11343 Message: 11388

Hi Steve,

If you are a real serious CW operator you will find the TS-830S fitted with two 500Hz filters a dream. This filter combination allows full use of the VBT function which allows you to narrow the passband down to 150Hz and in combination with the I/F shift is a really powerful tool. Any other filter combination does not allow the VBT to work effectively.
The original 500Hz Kenwood filters are YK-88C for 8.83MHz and YG-455C for 455kHz. Depending on their availability, you may consider obtaining the Inrad equivalents, (both 400Hz at -6db). i.e. Inrad #98 for 8.83MHz, shape factor 2.0 and #99 for 455kHz, shape factor 1.8, priced at $98 & $155 respectively.
The original Kenwood filters are solder in types as is the Inrad #99, but the #98 is a wire in type (nothing too challenging). The only other thing to do is select the appropriate filter set with the wire link, adjacent to the filters, in this case to CW4 position
I fitted the Kenwood filters when I bought my 830 in '82 and cannot complain about their performance. I have fitted many Inrad filters to my other rigs and they are excellent performers and are generally considered to be superior to the original filters of many rig manufacturers.
I believe Inrad are closing down at the end of this week, pending change of ownership, and will re-open in the new year.

Good luck with the 830, Best 73, Phil, VK6ABL.

Hi All,

Sorry to be here again, on the same area, the HV line.

I had got my radio back up and running after replacing the Filter capacitors as advised by this group. This worked out, and the radio is back operating.
I have however another concern. The HV line, from the manual, and by this group say the HV line should be 800v. Mine is putting out 915v. It is working all right, get it to load good, and I get good power out, by the external meter reading.
Am I looking too much into this? Or is this too high, and I have another problem? I can't see any control to lower this voltage.

Again thanks in advance.

I suppose the question has to be....is this the 'real' HT, measured
with a Multimeter with the covers off, or the 'indicated HT, as per
the Front Panel Meter.

Both my old 520SE and the 530S show a lot closer to 900 volts on the
front panel meter, and I have always assumed that it is about as
accurate as the S-meter readings - Hi !

Hi again Kevin

Two things spring immediately to mind. Do you have an unusually high AC line voltage - I assume that the radio is set up for 240 volts?

Secondly, if you really have over 900V HT, it means that if you still have 450 volt capacitors installed, they are working beyond their ratings. If I were you, I'd wait for the 500V units before running the radio again.

Kevin

Another note: be very careful putting a multimeter across the HT unless you are sure that it will handle that sort of voltage - some can't and will fry. If you want to make an accurate measurement of HT, rig up some sort of high resistance voltage divider and measure across each series element, adding the results to get a total.

Hi,
my TS-520 takes ages to warm up - in excess of 10 minutes. No receive now either. I think the tubes have gone. Also the tuning cap is scratchy. Think this is above me.

It is unlikely that the voltage is actually high. Probably the meter is wrong. Replace R-5, R-6, and R-7 on the rectifier board. These are 680 K 1/2 watt. Also replace R-8. This is 100K 1/2 watt.

I suppose the question has to be....is this the 'real' HT, measured
with a Multimeter with the covers off, or the 'indicated HT, as per
the Front Panel Meter.

Both my old 520SE and the 530S show a lot closer to 900 volts on the
front panel meter, and I have always assumed that it is about as
accurate as the S-meter readings - Hi !

The service manual shows that the high voltage filter capacitors are 100ufd with a working voltage of 500vdc each capacitor. If you have replaced both high voltage filter capacitors with 450vdc rated capacitor and your power supply is showing 915vdc, the filter caps total voltage rating has been exceeded. I would replace them with 500vdc rated capacitors.

The voltage you are seeing, 915vdc as in this case, is the unloaded high voltage power supply level. However, with a full load on the high voltage supply, for example, that shows 800vdc high voltage with final plate current reading of 250ma, that corresponds to 200 watts DC input. That corresponds to the manuals power rating.

Topic: 11389 Message: 11398

This was a problem with my TS-530 when my power-line voltage was 253V. I tried a voltage stabilising txformer, but it could not cope with the varying load of SSB. I fitted a 12 Volt bucking txformer which brought the supply down to about 240V. AS we are on a rural supply and had our own mini-substation, I persuaded the power company to lower the taps to 235V. The difference this has made to things like the mini-power 'bricks' and lamps is amazing. everything last longer and seems more stable. Computers and etc., run much cooler!

I have a recording voltmeter, and the mains surges that it shows up are quite worrying, a known problem with rural overhead lines. It also happens in areas that have had increased development. The power companies are loath to upgrade their lines until they are forced to.

Most that I have seen indicate around 900v in SSB. If the meter were off scale I would look at the metering resistors otherwise don't worry that's about right.

Kevin.

You have gotten some good comments back on the High Voltage. I had the same problem as Ron - high line voltage to my house. You definitely need to measure your line voltage so you know what you are dealing with. I use a filament transformer connected in the "buck" mode to reduce my line voltage down to 115VAC for all my old Kenwood and Collins equipment. I just went and checked my 520 and 830 to see what high voltage they indicated on their meters with 115 VAC input. This was done in the SSB mode with the load being the tube idling current of about 50Ma. One indicated 840vdc and the other indicated 850vdc. Without the reduction in my line voltage, they would be running about 900vdc.

If you want to really know what the voltage level is, you will need to use an accurate DVM and make measurements inside the radio, or follow Walt's advice and change out the resistors in the metering circuit, because resistor values do change with age. Mike also raises a valid concern about exceeding the voltage rating of the capacitors.

Hi All,

Sorry to be here again, on the same area, the HV line.

I had got my radio back up and running after replacing the Filter capacitors as advised by this group. This worked out, and the radio is back operating.
I have however another concern. The HV line, from the manual, and by this group say the HV line should be 800v. Mine is putting out 915v. It is working all right, get it to load good, and I get good power out, by the external meter reading.
Am I looking too much into this? Or is this too high, and I have another problem? I can't see any control to lower this voltage.

Again thanks in advance.

Date: 2006-12-12 03:40:45 UTC
From: the_tick_lives
Topic: 6438 Message: 11403

Ok so reading some of the other posts it seems that the VFO cable is almost impossible to find. Does anyone have a source for the connectors to build one?

I too have aqquired a VFO with no cable. I understand the 9 pin tube socket was a popular plug used in Japan but never quite made it successfully here.

I've tried eBAY, lots of the tube parts/accessories places, Surplus Sales of Nebraska, Fair Radio and Antique Electronic Supply. No luck. I can find the octals, but not the 9 pin.

The problem is the one that comes on the back of the radio is also missing. I have to read the manual again to see what that jumper does but I can't even use the radio until I find at least 1.

Any help is appreciated!

Thanks!
Allen

Drew,

I used a 7W night light from the local dollar store. Actually I guess it should be called the $2 store as that's what the light cost me. I drilled two holes in the rear of the tuner, one for the AC cable and one for my push button switch to stick through. I fabricated a bracket to space the switch back just enough to pop through the hole in the "in" position. I used double sided tape to attach the base of the light to the inside wall of the tuner and the bulb lines up right behind the meter. The meter does not have the same translucent properties as the meter in the 830. Light will not pass through it, only around it. But it does brighten the meter up enough for my liking.

Allen,
What rig are you working with ?
There is a surplus shop here that did have a BUNCH of the 9 pin connectors. I will get up there in the next couple of days to see if they still have the Bin full of them. If they do, I'll buy a couple and send them to you. If you are working on an 820, then you need to jump pins 8&9 on the VFO connector to get it to work. A bent Paper clip will do just that.
73,
Gordon

Topic: 11389 Message: 11409

Hi All,

I have checked our power supply to the house, and I get 236vAC, which is within the specs for our location. NZ main voltage is 230v, but I have never seen it actually be that.
I am using a Fluke 23 , as well as a Chi DV Meter, both read within 1v of each other, so I guess they are reading about the same. Both meters are speced for 1000v, and putting the leads across the HV I got 915, and 915.6v.
I could borrow one of the companies meters where I work, being a Steel Mill they have the heavy equipment to use and monitor.

I will change the diodes out, and I ordered new 500v capacitors to get my safety margin back up there. The radio is removed from mains until I get them.

Between the front panel meter and the DVM, I am happy with the readings from both, taking into account the front panel meter is not down to the last fraction of a volt.

Thanks

Kevin, ZL1KFM

Kevin.

You have gotten some good comments back on the High Voltage. I had the same problem as Ron - high line voltage to my house. You definitely need to measure your line voltage so you know what you are dealing with. I use a filament transformer connected in the "buck" mode to reduce my line voltage down to 115VAC for all my old Kenwood and Collins equipment. I just went and checked my 520 and 830 to see what high voltage they indicated on their meters with 115 VAC input. This was done in the SSB mode with the load being the tube idling current of about 50Ma. One indicated 840vdc and the other indicated 850vdc. Without the reduction in my line voltage, they would be running about 900vdc.

If you want to really know what the voltage level is, you will need to use an accurate DVM and make measurements inside the radio, or follow Walt's advice and change out the resistors in the metering circuit, because resistor values do change with age. Mike also raises a valid concern about exceeding the voltage rating of the capacitors.

Subject: [TS-520_820_530_830] TS-830S - HV, What is the Actual Voltage

Hi All,

Sorry to be here again, on the same area, the HV line.

I had got my radio back up and running after replacing the Filter capacitors as advised by this group. This worked out, and the radio is back operating.
I have however another concern. The HV line, from the manual, and by this group say the HV line should be 800v. Mine is putting out 915v. It is working all right, get it to load good, and I get good power out, by the external meter reading.
Am I looking too much into this? Or is this too high, and I have another problem? I can't see any control to lower this voltage.

Again thanks in advance.

11410. VFO cable Ye Olde Paper Clip Trick TS-520,820.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-12 09:40:56 UTC
From: n9wb
Topic: 11410 Message: 11410

Ye Olde Paper Clip Trick:

Looking at the back of the rig, find the space on the VFO socket. Count Counterclockwise to pins 8 and 9. These are the last two pins counter clockwise. As a double check, these are the first and second pins left of the space. Use a piece of a standard size paper clip and bend it into a U shape with legs about 1/4 inch long. Use this to connect pins 8 and 9 as located above. The standard size paper clip will have the correct wire diameter to simulate the plug pins. This will work in place of the jumper plug and you will be able to use your TS-520 or 820.

When you do make up a cable for the VFO, note that a couple of the wires need to be individually shielded.

Subject: [TS-520_820_530_830] VFO cable

Ok so reading some of the other posts it seems that the VFO cable is almost impossible to find. Does anyone have a source for the connectors to build one?

I too have aqquired a VFO with no cable. I understand the 9 pin tube socket was a popular plug used in Japan but never quite made it successfully here.

I've tried eBAY, lots of the tube parts/accessories places, Surplus Sales of Nebraska, Fair Radio and Antique Electronic Supply. No luck. I can find the octals, but not the 9 pin.

The problem is the one that comes on the back of the radio is also missing. I have to read the manual again to see what that jumper does but I can't even use the radio until I find at least 1.

Any help is appreciated!

Thanks!
Allen

11411. Re: [TS-520_820_530_830] TS-830S 236 volt mains.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-12 10:57:03 UTC
From: n9wb
Topic: 11411 Message: 11411

You should check to see if your transformer is set correctly. I don't believe that your TS-830 has a 120/220 switch on the rear panel. It is possible that the primary on the power transformer is wired wrong. On the primary side of the power transformer you will see two sets of taps labeled as follows: 120, 100, and 0.

With your mains voltage the transformer should be set as follows:

The windings are connected in series and in phase. There should a jumper between the 0 terminal on one winding and the 120 terminal on the other.

Then one wire from the mains (on off switch) should connect to the remaining 0 or 120 terminal. Another wire from the mains (fuse holder) should connect to the other remaining 0 or 120 terminal. So you have a series circuit. One mains wire goes through the switch and into winding #1. The circuit then comes from the other end of winding # 1 and goes into winding #2 by way of the jumper. The circuit then comes from the other end of winding # 2 to the mains wire through the fuse.

What you need to look for is whether either of both of the 100 terminals are being used instead of the 120.

Now where this will get tricky is that there will be a connection from one of the 100 terminals for the fan. Tell me what you have and the wire colours. I will suggest what to do if anything.

Disregarding the fan connections, If both 100 taps are used instead of the 120 taps, the rig is wired for 200 V. If one 120 and one 100 tap are used, the rig is wired for 220 volts. If both 120 taps are used, the rig is wired for 240 and that is what you want.

Before changing anything tell me what you have. It is very important that these windings be kept in phase. If changes must be made, the jumper should not be removed from it's 0 tap. If it goes to a 100 tap instead of a 120 tap, then only that end of the jumper should be moved to the 120 tap on the same winding.

Odds are your manual will show connections in parallel for 120 Volts on the diagram. So don't let this confuse you.

In my owner's manual on page 29, Paragraph 6.7 see instructions for 240 V operation. I am guessing that you may be wired for 220 instead of 240 V operation.

Use should use a 4 amp fuse instead of a 6 amp with mains voltages over 200 v.

In the files section of this group is a article about a light bulb tester. " Save your transformer". Using this when testing the rig after changes will save the transformer from damage if a diode or capacitor that is faulty, or installed incorrectly. Also it will save the transformer if it gets mis wired or a solder bridge develops during soldering.

Subject: Re: [TS-520_820_530_830] TS-830S - HV, What is the Actual Voltage

Hi All,

I have checked our power supply to the house, and I get 236vAC, which is within the specs for our location. NZ main voltage is 230v, but I have never seen it actually be that.
I am using a Fluke 23 , as well as a Chi DV Meter, both read within 1v of each other, so I guess they are reading about the same. Both meters are speced for 1000v, and putting the leads across the HV I got 915, and 915.6v.
I could borrow one of the companies meters where I work, being a Steel Mill they have the heavy equipment to use and monitor.

I will change the diodes out, and I ordered new 500v capacitors to get my safety margin back up there. The radio is removed from mains until I get them.

Between the front panel meter and the DVM, I am happy with the readings from both, taking into account the front panel meter is not down to the last fraction of a volt.

Thanks

Kevin.

You have gotten some good comments back on the High Voltage. I had the same problem as Ron - high line voltage to my house. You definitely need to measure your line voltage so you know what you are dealing with. I use a filament transformer connected in the "buck" mode to reduce my line voltage down to 115VAC for all my old Kenwood and Collins equipment. I just went and checked my 520 and 830 to see what high voltage they indicated on their meters with 115 VAC input. This was done in the SSB mode with the load being the tube idling current of about 50Ma. One indicated 840vdc and the other indicated 850vdc. Without the reduction in my line voltage, they would be running about 900vdc.

If you want to really know what the voltage level is, you will need to use an accurate DVM and make measurements inside the radio, or follow Walt's advice and change out the resistors in the metering circuit, because resistor values do change with age. Mike also raises a valid concern about exceeding the voltage rating of the capacitors.

When making a post, please place the rig model # and make if it is not a Kenwood in the subject line and/or at the top of the message itself. A lot of time we can be more specific in helping you if we know what rig you are using. Even if you have told us previously, it is hard to remember when we get several of these troubleshooting threads going at once.

And beside that, I'm 57 years olde. I can't even remember why I am writing this message.

Bill, you are a man after my own heart, you know what a bucking transformer is. It is surprising how many people do not know this trick, and of course it works the other way. I used a 12V lighting transformer, which had a 4A 12V secondary. There is a brilliant circuit in the ARRL Handbook 1985 6-2, which shows how to build a Boost/Buck supply using a low current Variac and another transformer.

It's worth a read if you have power line problems.

Ron.

When you build stuff out of your junk box, you have to learn how to improvise. I'm leaving town for a couple of days so I'll let you explain the "buck-boost" arrangements. I learned about this back in the late 1950's so assumed most everyone else knew it.

Walt - wait until you get to age 65 - you don't even remember that you forgot.

Kenwood says they are discontinued.

Jumper pins 8-9 to make the radio work. The 9v for the main vfo is routed thru the remote vfo and back.

11419. TS-820S Excessive Idle Current

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-12 18:01:43 UTC
From: k8wvg
Topic: 11419 Message: 11419

Happy to have found the group!

During tuneup of my 820s a check of idle plate current showed a correct 60ma. Continuing to adjust driver, plate, and load, I heard a "snap" in the rf final/rf board area and Ip pegged the meter. No smoke was seen.

After a quick shutdown and repower, a check of idle current on SEND showed a pegged meter again. Checking after Turning SG OFF shows expected zero current.

A swap of finals to known good tubes resulted in the same symptom, pegged idle current. Following some of the threads on this forum I pulled the finals, powered on with SG OFF and checked the following (at the RF board edge connectors):

FG: -96.1 volts
VR1: -103.5 volts (negative hot end of bias resistor)
VR2: -96.9 volts (bias pot wiper)
VR3: -94.5 volts (other end of bias pot, seems this should be nearer zero volts)

For jollies I pulled the rf board and extracted Q5 (checks OK with ohm meter and transistor checker), D7 (ok), and R38 (approx. 10K). No burned components are visible on the rf board or anywhere in the final assembly.

Hints/advice on other likely culprits gladly accepted.

Hi Walt,

I was thinking after I sent my message that I should of put what tap setting I had.
Walt, in my case I have it set in series for 240v, (120+120). The radio came from Japan in this configuration, and the switch in the back is for 230/240v, no 110v for us. And it is set on 240, with a stop plate to prevent easy change.
So no changes are required within the voltage supply.

Thanks for your input Walt.

Kevin, ZL1KFM.

Subject: Re: [TS-520_820_530_830] TS-830S 236 volt mains.

You should check to see if your transformer is set correctly. I don't believe that your TS-830 has a 120/220 switch on the rear panel. It is possible that the primary on the power transformer is wired wrong. On the primary side of the power transformer you will see two sets of taps labeled as follows: 120, 100, and 0.

With your mains voltage the transformer should be set as follows:

The windings are connected in series and in phase. There should a jumper between the 0 terminal on one winding and the 120 terminal on the other.

Then one wire from the mains (on off switch) should connect to the remaining 0 or 120 terminal. Another wire from the mains (fuse holder) should connect to the other remaining 0 or 120 terminal. So you have a series circuit. One mains wire goes through the switch and into winding #1. The circuit then comes from the other end of winding # 1 and goes into winding #2 by way of the jumper. The circuit then comes from the other end of winding # 2 to the mains wire through the fuse.

What you need to look for is whether either of both of the 100 terminals are being used instead of the 120.

Now where this will get tricky is that there will be a connection from one of the 100 terminals for the fan. Tell me what you have and the wire colours. I will suggest what to do if anything.

Disregarding the fan connections, If both 100 taps are used instead of the 120 taps, the rig is wired for 200 V. If one 120 and one 100 tap are used, the rig is wired for 220 volts. If both 120 taps are used, the rig is wired for 240 and that is what you want.

Before changing anything tell me what you have. It is very important that these windings be kept in phase. If changes must be made, the jumper should not be removed from it's 0 tap. If it goes to a 100 tap instead of a 120 tap, then only that end of the jumper should be moved to the 120 tap on the same winding.

Odds are your manual will show connections in parallel for 120 Volts on the diagram. So don't let this confuse you.

In my owner's manual on page 29, Paragraph 6.7 see instructions for 240 V operation. I am guessing that you may be wired for 220 instead of 240 V operation.

Use should use a 4 amp fuse instead of a 6 amp with mains voltages over 200 v.

In the files section of this group is a article about a light bulb tester. " Save your transformer". Using this when testing the rig after changes will save the transformer from damage if a diode or capacitor that is faulty, or installed incorrectly. Also it will save the transformer if it gets mis wired or a solder bridge develops during soldering.

Subject: Re: [TS-520_820_530_830] TS-830S - HV, What is the Actual Voltage

Hi All,

I have checked our power supply to the house, and I get 236vAC, which is within the specs for our location. NZ main voltage is 230v, but I have never seen it actually be that.
I am using a Fluke 23 , as well as a Chi DV Meter, both read within 1v of each other, so I guess they are reading about the same. Both meters are speced for 1000v, and putting the leads across the HV I got 915, and 915.6v.
I could borrow one of the companies meters where I work, being a Steel Mill they have the heavy equipment to use and monitor.

I will change the diodes out, and I ordered new 500v capacitors to get my safety margin back up there. The radio is removed from mains until I get them.

Between the front panel meter and the DVM, I am happy with the readings from both, taking into account the front panel meter is not down to the last fraction of a volt.

Thanks

Subject: Re: [TS-520_820_530_830] TS-830S - HV, What is the Actual Voltage

Kevin.

You have gotten some good comments back on the High Voltage. I had the same problem as Ron - high line voltage to my house. You definitely need to measure your line voltage so you know what you are dealing with. I use a filament transformer connected in the "buck" mode to reduce my line voltage down to 115VAC for all my old Kenwood and Collins equipment. I just went and checked my 520 and 830 to see what high voltage they indicated on their meters with 115 VAC input. This was done in the SSB mode with the load being the tube idling current of about 50Ma. One indicated 840vdc and the other indicated 850vdc. Without the reduction in my line voltage, they would be running about 900vdc.

If you want to really know what the voltage level is, you will need to use an accurate DVM and make measurements inside the radio, or follow Walt's advice and change out the resistors in the metering circuit, because resistor values do change with age. Mike also raises a valid concern about exceeding the voltage rating of the capacitors.

Subject: [TS-520_820_530_830] TS-830S - HV, What is the Actual Voltage

Hi All,

Sorry to be here again, on the same area, the HV line.

I had got my radio back up and running after replacing the Filter capacitors as advised by this group. This worked out, and the radio is back operating.
I have however another concern. The HV line, from the manual, and by this group say the HV line should be 800v. Mine is putting out 915v. It is working all right, get it to load good, and I get good power out, by the external meter reading.
Am I looking too much into this? Or is this too high, and I have another problem? I can't see any control to lower this voltage.

Again thanks in advance.

Bill.

I've done it in a fashion, are any of the older ARRl Handbooks on line anywhere?

I'm a few weeks short of eleven years past the age to remember that I forgot, (76). I now forget what I forgot I forgot, amazingly, I put my underpants on the right way round nine times out of ten. Do you have trouble recognizing the man you see in the mirror in the morning? ;-).

My kids don't seem to think I forgot, judging by the requests I get. The Grand-kids, think I'm brilliant, much cleverer than their Dads, so it is true, "You can fool some of the people all of the time"!!!

Ron.

When you build stuff out of your junk box, you have to learn how to improvise. I'm leaving town for a couple of days so I'll let you explain the "buck-boost" arrangements. I learned about this back in the late 1950's so assumed most everyone else knew it.

Walt - wait until you get to age 65 - you don't even remember that you forgot.

Bill, you are a man after my own heart, you know what a bucking transformer is. It is surprising how many people do not know this trick, and of course it works the other way. I used a 12V lighting transformer, which had a 4A 12V secondary. There is a brilliant circuit in the ARRL Handbook 1985 6-2, which shows how to build a Boost/Buck supply using a low current Variac and another

transformer.

It's worth a read if you have power line problems.

Topic: 11389 Message: 11422

It's very simple, you wire the Primary as normal across the power line, the Secondary is then wired in series with the power line to your rig and etc, One way this will add 12V to the power lines volts, (Boost), the other way will reduce the line voltage by 12V. The actual voltage is approximate as it depends on the incoming line voltage. It is preferable to use a transformer that has good insulation from the secondary to the core, otherwise the core could reach line voltage. For that reason it is preferable to wire the Secondary in series with the Neutral line, (I'm not sure what you call it Stateside). The Secondary must be able to carry the maximum current you are using, in which case the primary will be OK.

I'm not very good at scanning files, but I will try and copy the circuits and etc., from the ARRL Handbook, in to the files section.

If anyone has the 1985 Handbook, (this 'Limey' going to hang on to his), it's in section 6-2. Similar circuits are shown in the 1970 Handbook page 328, 1959 Handbook page 240. I haven't any later Handbooks, but I would guess it will be in later editions.

I'm sorry that it's a bit long-winded, I never use one word, when six will do.

I've scanned the Schematic, Files says it's too big so it's a jpeg in photos, you can't miss it. I'll type the text in to a post tomorrow, it's not very long.

I couldn't find it in the 1946 Handbook, probably not searching right, I am very old ;-)

Allen,

This is John-KA3DPW. What VFO are you looking for a cable for?

I just bought one on ebay for my TS-830 and I see them every so often there. they are a straight thru cabling as I understand. I know a couple of sources to these in searches that find these occasionally. I got this one as a back up for my equipment. I like to keep extras when it's feasible. I get them for about 20 or 25 US dollars.

VFO's appear without cables several times a year I got one that way and had to get a cable separately.

VFO and amplifier relay cables show up on ebay, you just have to watch over time. The ones that are less often found are the transverter cables. the connectors at the transverter unit itself are something you would more likely have to make a substitute yourself.

Now 530 and 830 are more common than for say the 520.

So fill me in on what your looking for.

the_tick_lives <the_tick_lives@...> wrote:
Ok so reading some of the other posts it seems that the VFO cable is
almost impossible to find. Does anyone have a source for the
connectors to build one?

I too have aqquired a VFO with no cable. I understand the 9 pin tube
socket was a popular plug used in Japan but never quite made it
successfully here.

I've tried eBAY, lots of the tube parts/accessories places, Surplus
Sales of Nebraska, Fair Radio and Antique Electronic Supply. No
luck. I can find the octals, but not the 9 pin.

The problem is the one that comes on the back of the radio is also
missing. I have to read the manual again to see what that jumper
does but I can't even use the radio until I find at least 1.

Any help is appreciated!

Thanks!
Allen

Jack at the risk of sounding kind of dumb, I say clean the rig and give it a good going over. pull all connectors and spray with contact cleaner one at a time and put them back on several times after that. this gets the dirt out of the contacts. Also the mounts that hold them down especially the grounding ones. back them out and clean them and put them back in. I've found it makes a difference in problems when you do this. The connections are clean and tight fitting.

If this doesn't work then get a magnifying glass and go over the board looking for bad solder joints.

Eliminate these more obvious things. they are cheaper and worth the time. Many times they eliminate problems. You may not know what it was but if its gone when you turn it on, then you got the problem.

Jack <kf4yio@...> wrote:
Hi all. Hope you can point me in the right direction. My TS820S has
an intermittant problem where the display will go blank for a second
or so and the audio will drop out. The display returns to normal and
the audio returns normally depending on the agc setting. Prior to
this, my display would drop one digit (usually the khz (100's)) and
return. I'm thinking I need to remove the display boards and clean
all the contacts but what might be causing the entire display and
audio to drop?

Thanks - Jack KF4YIO

Grant clean tuning capacitor. They get dirty and sound scratchy upon turning. Use a good tuning cleaner that doesn't leave a residue. Do not try to force anything between the plates as they will lose thier spacing. Clean it with a spray and see what happens.

Second check your filament voltage and current. You shouldn't be that slow heating a directly heated valve. If there's that long a time heating up your filaments then odds are your not getting enough power to heat the tube. It may be they are old or it may be something is keeping the circuit from supplying the needed power to the tubes.

Try a tube swap first.

Grant McDuling <grantmcduling@...> wrote:
Hi,
my TS-520 takes ages to warm up - in excess of 10 minutes. No receive now either. I think the tubes have gone. Also the tuning cap is scratchy. Think this is above me.

From: Edwin
Topic: 11430 Message: 11430

Without going into a long story, (5years), my TS-820 bandswitch has become misaligned with the front panel bandswitch and I have to realign the two. As far as I can tell the DRIVE rear wafer PC board, AUX transformer's trace is the outside trace on the right hand side of the board as viewed from the rear. If you follow this trace up to it's contact it end's up at the top of the board, just to the right of the 12 o'clock position as viewed from the rear.
Would or could anyone verify this or give an easier way to time these two switches.
Thanks a lot
Edwin

Check all the operating voltages. It sounds like a low voltage
somewhere might be the cause of both problems.

Topic: 11411 Message: 11433

OK,that eliminates one concern. What is the plate voltage when you are tuned up full tilt on CW ? Does it drop a lot? Also, you might want to check the screen voltage. This is available at a point labeled SG on the final board.

On the transformer there is a tap labeled 12.6 and a adjacent tap labeled 0. This 0 tap goes to chassis ground. With the tube filaments on what does the 12.6 tap read to ground on AC volts ?

There are a couple of things that concern me about this high plate voltage, some good, some bad. I will explain more when I see the above information.

Each of the filter capacitors have 470 K bleeder resistors across them. These should be checked or just replaced. If you check them, be sure to let the rig set for a while and then short across the capacitors before connecting your ohm meter. Putting a clip lead across each capacitor for a few minutes will fully discharge them. A charge in them may damage your ohm meter.

These serve two purposes. First, they slowly discharge the caps when power is off for personal safety. Second, they provide a bit of balance between the capacitors when there is a low load on it. If they went very high in value, I suppose that they might allow the unloaded voltage to go higher than normal. That is one of a couple of reasons that I am interested what the rig's HV meter reads on SSB no Audio compared to 100 watts or so of CW output.

If the high voltage is just a bit high and the capacitors are rated at a high enough voltage to deal with it, that in and of itself will not be a problem. It will just give you a bit more power. However, if the filaments are running high and the 14 volt buss is running high, that might be troublesome.

Hi Walt,

I was thinking after I sent my message that I should of put what tap setting I had.
Walt, in my case I have it set in series for 240v, (120+120). The radio came from Japan in this configuration, and the switch in the back is for 230/240v, no 110v for us. And it is set on 240, with a stop plate to prevent easy change.
So no changes are required within the voltage supply.

Thanks for your input Walt.

Kevin, ZL1KFM.

Subject: Re: [TS-520_820_530_830] TS-830S 236 volt mains.

You should check to see if your transformer is set correctly. I don't believe that your TS-830 has a 120/220 switch on the rear panel. It is possible that the primary on the power transformer is wired wrong. On the primary side of the power transformer you will see two sets of taps labeled as follows: 120, 100, and 0.

With your mains voltage the transformer should be set as follows:

The windings are connected in series and in phase. There should a jumper between the 0 terminal on one winding and the 120 terminal on the other.

Then one wire from the mains (on off switch) should connect to the remaining 0 or 120 terminal. Another wire from the mains (fuse holder) should connect to the other remaining 0 or 120 terminal. So you have a series circuit. One mains wire goes through the switch and into winding #1. The circuit then comes from the other end of winding # 1 and goes into winding #2 by way of the jumper. The circuit then comes from the other end of winding # 2 to the mains wire through the fuse.

What you need to look for is whether either of both of the 100 terminals are being used instead of the 120.

Now where this will get tricky is that there will be a connection from one of the 100 terminals for the fan. Tell me what you have and the wire colours. I will suggest what to do if anything.

Disregarding the fan connections, If both 100 taps are used instead of the 120 taps, the rig is wired for 200 V. If one 120 and one 100 tap are used, the rig is wired for 220 volts. If both 120 taps are used, the rig is wired for 240 and that is what you want.

Before changing anything tell me what you have. It is very important that these windings be kept in phase. If changes must be made, the jumper should not be removed from it's 0 tap. If it goes to a 100 tap instead of a 120 tap, then only that end of the jumper should be moved to the 120 tap on the same winding.

Odds are your manual will show connections in parallel for 120 Volts on the diagram. So don't let this confuse you.

In my owner's manual on page 29, Paragraph 6.7 see instructions for 240 V operation. I am guessing that you may be wired for 220 instead of 240 V operation.

Use should use a 4 amp fuse instead of a 6 amp with mains voltages over 200 v.

In the files section of this group is a article about a light bulb tester. " Save your transformer". Using this when testing the rig after changes will save the transformer from damage if a diode or capacitor that is faulty, or installed incorrectly. Also it will save the transformer if it gets mis wired or a solder bridge develops during soldering.

Subject: Re: [TS-520_820_530_830] TS-830S - HV, What is the Actual Voltage

Hi All,

I have checked our power supply to the house, and I get 236vAC, which is within the specs for our location. NZ main voltage is 230v, but I have never seen it actually be that.
I am using a Fluke 23 , as well as a Chi DV Meter, both read within 1v of each other, so I guess they are reading about the same. Both meters are speced for 1000v, and putting the leads across the HV I got 915, and 915.6v.
I could borrow one of the companies meters where I work, being a Steel Mill they have the heavy equipment to use and monitor.

I will change the diodes out, and I ordered new 500v capacitors to get my safety margin back up there. The radio is removed from mains until I get them.

Between the front panel meter and the DVM, I am happy with the readings from both, taking into account the front panel meter is not down to the last fraction of a volt.

Thanks

Subject: Re: [TS-520_820_530_830] TS-830S - HV, What is the Actual Voltage

Kevin.

You have gotten some good comments back on the High Voltage. I had the same problem as Ron - high line voltage to my house. You definitely need to measure your line voltage so you know what you are dealing with. I use a filament transformer connected in the "buck" mode to reduce my line voltage down to 115VAC for all my old Kenwood and Collins equipment. I just went and checked my 520 and 830 to see what high voltage they indicated on their meters with 115 VAC input. This was done in the SSB mode with the load being the tube idling current of about 50Ma. One indicated 840vdc and the other indicated 850vdc. Without the reduction in my line voltage, they would be running about 900vdc.

If you want to really know what the voltage level is, you will need to use an accurate DVM and make measurements inside the radio, or follow Walt's advice and change out the resistors in the metering circuit, because resistor values do change with age. Mike also raises a valid concern about exceeding the voltage rating of the capacitors.

Subject: [TS-520_820_530_830] TS-830S - HV, What is the Actual Voltage

Hi All,

Sorry to be here again, on the same area, the HV line.

I had got my radio back up and running after replacing the Filter capacitors as advised by this group. This worked out, and the radio is back operating.
I have however another concern. The HV line, from the manual, and by this group say the HV line should be 800v. Mine is putting out 915v. It is working all right, get it to load good, and I get good power out, by the external meter reading.
Am I looking too much into this? Or is this too high, and I have another problem? I can't see any control to lower this voltage.

Again thanks in advance.

Thanks for posting this, Gordon. Just an FYI for others: Anyone with the 1984 edition of the Handbook will find the buck-and-boost description on page 5-2. It's in the chapter titled "AC-Operated Power Supplies."

Subject: Re: [TS-520_820_530_830] TS-830S 236 volt mains.

OK,that eliminates one concern. What is the plate voltage when you are tuned up full tilt on CW ? Does it drop a lot? Also, you might want to check the screen voltage. This is available at a point labeled SG on the final board.

On the transformer there is a tap labeled 12.6 and a adjacent tap labeled 0. This 0 tap goes to chassis ground. With the tube filaments on what does the 12.6 tap read to ground on AC volts ?

KM) - The 12.6vAC no-load is reading 12.76v, under load when Send is pressed, it drops to 12.66vAC, so I would expect this reading to be okay.

There are a couple of things that concern me about this high plate voltage, some good, some bad. I will explain more when I see the above information.

Each of the filter capacitors have 470 K bleeder resistors across them. These should be checked or just replaced. If you check them, be sure to let the rig set for a while and then short across the capacitors before connecting your ohm meter. Putting a clip lead across each capacitor for a few minutes will fully discharge them. A charge in them may damage your ohm meter.

KM) - I replaced the resistors and the 2x .01uF caps that go across the filter capacitors. The orignal resistors were okay, but seeing how they were wrapped around the filters caps, I decided to just change everything for new. The .01 caps should not go, as I only had 1500v ones, so used these.

These serve two purposes. First, they slowly discharge the caps when power is off for personal safety. Second, they provide a bit of balance between the capacitors when there is a low load on it. If they went very high in value, I suppose that they might allow the unloaded voltage to go higher than normal. That is one of a couple of reasons that I am interested what the rig's HV meter reads on SSB no Audio compared to 100 watts or so of CW output.

KM) - Checking the HV meter, and I also used my Fluke.

Under no-load, the fluke was reading around 915vDC, under load, with send switch on, this dropped to 855vDC, the meter was reading around 850v. So again, this appears to be operating correctly.

If the high voltage is just a bit high and the capacitors are rated at a high enough voltage to deal with it, that in and of itself will not be a problem. It will just give you a bit more power. However, if the filaments are running high and the 14 volt buss is running high, that might be troublesome.

Guess then, with the information you have supplied, and the information returned from your questions, is that the radio appears to be operating as it should. Voltages are within required specs. In my case, the filter caps were the reason for my non-working TS-830.

Again, Thanks for you continual help and patance over this matter.

An excelent Elmer!

Vy 73, Walt N9WB

Subject: Re: [TS-520_820_530_830] TS-830S 236 volt mains.

Hi Walt,

I was thinking after I sent my message that I should of put what tap setting I had.
Walt, in my case I have it set in series for 240v, (120+120). The radio came from Japan in this configuration, and the switch in the back is for 230/240v, no 110v for us. And it is set on 240, with a stop plate to prevent easy change.
So no changes are required within the voltage supply.

Thanks for your input Walt.

Kevin, ZL1KFM.

Subject: Re: [TS-520_820_530_830] TS-830S 236 volt mains.

You should check to see if your transformer is set correctly. I don't believe that your TS-830 has a 120/220 switch on the rear panel. It is possible that the primary on the power transformer is wired wrong. On the primary side of the power transformer you will see two sets of taps labeled as follows: 120, 100, and 0.

With your mains voltage the transformer should be set as follows:

The windings are connected in series and in phase. There should a jumper between the 0 terminal on one winding and the 120 terminal on the other.

Then one wire from the mains (on off switch) should connect to the remaining 0 or 120 terminal. Another wire from the mains (fuse holder) should connect to the other remaining 0 or 120 terminal. So you have a series circuit. One mains wire goes through the switch and into winding #1. The circuit then comes from the other end of winding # 1 and goes into winding #2 by way of the jumper. The circuit then comes from the other end of winding # 2 to the mains wire through the fuse.

What you need to look for is whether either of both of the 100 terminals are being used instead of the 120.

Now where this will get tricky is that there will be a connection from one of the 100 terminals for the fan. Tell me what you have and the wire colours. I will suggest what to do if anything.

Disregarding the fan connections, If both 100 taps are used instead of the 120 taps, the rig is wired for 200 V. If one 120 and one 100 tap are used, the rig is wired for 220 volts. If both 120 taps are used, the rig is wired for 240 and that is what you want.

Before changing anything tell me what you have. It is very important that these windings be kept in phase. If changes must be made, the jumper should not be removed from it's 0 tap. If it goes to a 100 tap instead of a 120 tap, then only that end of the jumper should be moved to the 120 tap on the same winding.

Odds are your manual will show connections in parallel for 120 Volts on the diagram. So don't let this confuse you.

In my owner's manual on page 29, Paragraph 6.7 see instructions for 240 V operation. I am guessing that you may be wired for 220 instead of 240 V operation.

Use should use a 4 amp fuse instead of a 6 amp with mains voltages over 200 v.

In the files section of this group is a article about a light bulb tester. " Save your transformer". Using this when testing the rig after changes will save the transformer from damage if a diode or capacitor that is faulty, or installed incorrectly. Also it will save the transformer if it gets mis wired or a solder bridge develops during soldering.

Subject: Re: [TS-520_820_530_830] TS-830S - HV, What is the Actual Voltage

Hi All,

I have checked our power supply to the house, and I get 236vAC, which is within the specs for our location. NZ main voltage is 230v, but I have never seen it actually be that.
I am using a Fluke 23 , as well as a Chi DV Meter, both read within 1v of each other, so I guess they are reading about the same. Both meters are speced for 1000v, and putting the leads across the HV I got 915, and 915.6v.

I could borrow one of the companies meters where I work, being a Steel Mill they have the heavy equipment to use and monitor.

I will change the diodes out, and I ordered new 500v capacitors to get my safety margin back up there. The radio is removed from mains until I get them.

Between the front panel meter and the DVM, I am happy with the readings from both, taking into account the front panel meter is not down to the last fraction of a volt.

Thanks

Subject: Re: [TS-520_820_530_830] TS-830S - HV, What is the Actual Voltage

Kevin.

You have gotten some good comments back on the High Voltage. I had the same problem as Ron - high line voltage to my house. You definitely need to measure your line voltage so you know what you are dealing with. I use a filament transformer connected in the "buck" mode to reduce my line voltage down to 115VAC for all my old Kenwood and Collins equipment. I just went and checked my 520 and 830 to see what high voltage they indicated on their meters with 115 VAC input. This was done in the SSB mode with the load being the tube idling current of about 50Ma. One indicated 840vdc and the other indicated 850vdc. Without the reduction in my line voltage, they would be running about 900vdc.

If you want to really know what the voltage level is, you will need to use an accurate DVM and make measurements inside the radio, or follow Walt's advice and change out the resistors in the metering circuit, because resistor values do change with age. Mike also raises a valid concern about exceeding the voltage rating of the capacitors.

Subject: [TS-520_820_530_830] TS-830S - HV, What is the Actual Voltage

Hi All,

Sorry to be here again, on the same area, the HV line.

I had got my radio back up and running after replacing the Filter capacitors as advised by this group. This worked out, and the radio is back operating.
I have however another concern. The HV line, from the manual, and by this group say the HV line should be 800v. Mine is putting out 915v. It is working all right, get it to load good, and I get good power out, by the external meter reading.

Am I looking too much into this? Or is this too high, and I have another problem? I can't see any control to lower this voltage.

Again thanks in advance.

11437. Buck Transformer (or Boost) for less than optimum Mains Voltages

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-13 20:50:08 UTC
From: Larry Shorthill
Topic: 11437 Message: 11437

One of the most prolific and best technical discussion groups I ever engaged with (besides this one)is a group that worked on the R390A receiver. For those of you who are not familiar with this RX, it is a 500KHz (KCycle) to 32MHz (MCycle) general coverage RX originally developed by Collins for the military. Is was the 2nd Mark of the family and was all tubes. It was produced by numerous contractors from Collins and Motorola to (allegedly) Helena Rubenstein (though no one has ever reported seeing one from that company).

It was, and still is, a standard by which other RXs are judged and for a tube rig was famous for its stabilty and performance. It was extensively used in the Vietnam era and it is a piece of cold war legend. Several of these were on the ill fated Pueblo that N Korea captured. Rumor has it that these were to be destroyed in the event of capture (but the Pueblo crew didn't have the time) and that general in service, many were alleged to have been rigged with some type of explosive just in case of capture. I could go on but I need to get to the point of this topic.

The R390A is not for the faint of heart as a casual hobbiest RX since it is big, heavy, and dissipates a lot of heat. Two of the tubes in that beast are rectifiers and a Naval field upgrade was to remove them and replace them with Silicon rectifiers with a resultant rise in rectified voltages throughout the RX. This stressed all of the components with higher dissipation and higher voltages applied, but the Navy figured it was worth it.

Many R390A restorers are actually going back to the tube rectifiers to unstress their rigs but the extra heat generated from the rectifiers, in my mind isn't worth it. A better way to reduce the stress on the circuitry is to reduce the input voltages applied and some use variacs mounted along side their R390A. Another way is by using a voltage buck transformer either mounted inside the RX or as an adjunct to it.

For references on the transformer circuit used, just google 'R390a buck transformer' and a few references will come up. However, here is a good link to see the R390A in its glory, and at the bottom of the site is a link to compensate high voltages. Also, in case someone has a low voltage condition, the buck transformer can be configured in opposite polarity to boost the mains voltage.

http://www.r-390a.net/

If you think the Kenwood Hybrids are a gas, I recommend you keep your eye out for an R390A in reasonable condition. Your appreciation of

tube electronics will go up exponentially once you start dabbling in these things. They make the TS-830 look like a piece of cake.

Best regards and Merry Christmas to everyone.

Larry
KC7ULI

11438. Re: [TS-520_820_530_830] TS-830S 236 volt mains.

From: n9wb
Topic: 11411 Message: 11438

In summary, since the filament voltage is well within spec, I don't think you have any issues except for the need for more voltage head room on the filter caps. however it was good to visit possible other issues.

I didn't want to cause you to panic, but I wanted to be sure that you did not have a shorted turn on the transformer primary. Fortunately, you don't since the 12.6 is very well within spec. The 850 to 855 volts with load is not really that high. The additional increase under no load is probably due to the increased storage capacity of the 150 uf caps.

I would probably trust the Fluke over the multimeter in the rig. Choosing 680 K and a 100 K resistor that is very close to these values in tolerance should improve the multimeter accuracy. So when you get the new caps, you should have a good healthy rig. Be sure to use a 4 amp fast fuse for protection since your mains voltage is higher.

Hope to hear you on the air.

If you check them, be sure to let the rig set for a while and then short across the capacitors before connecting your ohm meter. Putting a clip lead across each capacitor for a few minutes will fully discharge them. A charge in them may damage your ohm meter.

KM) - I replaced the resistors and the 2x .01uF caps that go across the filter capacitors. The orignal resistors were okay, but seeing how they were wrapped around the filters caps, I decided to just change everything for new. The .01 caps should not go, as I only had 1500v ones, so used these.

These serve two purposes. First, they slowly discharge the caps when power is off for personal safety. Second, they provide a bit of balance between the capacitors when there is a low load on it. If they went very high in value, I suppose that they might allow the unloaded voltage to go higher than normal. That is one of a couple of reasons that I am interested what the rig's HV meter reads on SSB no Audio compared to 100 watts or so of CW output.

KM) - Checking the HV meter, and I also used my Fluke.

Under no-load, the fluke was reading around 915vDC, under load, with send switch on, this dropped to 855vDC, the meter was reading around 850v. So again, this appears to be operating correctly.

If the high voltage is just a bit high and the capacitors are rated at a high enough voltage to deal with it, that in and of itself will not be a problem. It will just give you a bit more power. However, if the filaments are running high and the 14 volt buss is running high, that might be troublesome.

Guess then, with the information you have supplied, and the information returned from your questions, is that the radio appears to be operating as it should. Voltages are within required specs. In my case, the filter caps were the reason for my non-working TS-830.

Again, Thanks for you continual help and patance over this matter.

An excelent Elmer!

Vy 73, Walt N9WB

Subject: Re: [TS-520_820_530_830] TS-830S 236 volt mains.

Hi Walt,

I was thinking after I sent my message that I should of put what tap setting I had.
Walt, in my case I have it set in series for 240v, (120+120). The radio came from Japan in

this configuration, and the switch in the back is for 230/240v, no 110v for us. And it is set on 240, with a stop plate to prevent easy change.
So no changes are required within the voltage supply.

Thanks for your input Walt.

Subject: Re: [TS-520_820_530_830] TS-830S 236 volt mains.

You should check to see if your transformer is set correctly. I don't believe that your TS-830 has a 120/220 switch on the rear panel. It is possible that the primary on the power transformer is wired wrong. On the primary side of the power transformer you will see two sets of taps labeled as follows: 120, 100, and 0.

With your mains voltage the transformer should be set as follows:

The windings are connected in series and in phase. There should a jumper between the 0 terminal on one winding and the 120 terminal on the other.

Then one wire from the mains (on off switch) should connect to the remaining 0 or 120 terminal. Another wire from the mains (fuse holder) should connect to the other remaining 0 or 120 terminal. So you have a series circuit. One mains wire goes through the switch and into winding #1. The circuit then comes from the other end of winding # 1 and goes into winding #2 by way of the jumper. The circuit then comes from the other end of winding # 2 to the mains wire through the fuse.

What you need to look for is whether either of both of the 100 terminals are being used instead of the 120.

Now where this will get tricky is that there will be a connection from one of the 100 terminals for the fan. Tell me what you have and the wire colours. I will suggest what to do if anything.

Disregarding the fan connections, If both 100 taps are used instead of the 120 taps, the rig is wired for 200 V. If one 120 and one 100 tap are used, the rig is wired for 220 volts. If both 120 taps are used, the rig is wired for 240 and that is what you want.

Before changing anything tell me what you have. It is very important that these windings be kept in phase. If changes must be made, the jumper should not be removed from it's 0 tap. If it goes to a 100 tap instead of a 120 tap, then only that end of the jumper should be moved to the 120 tap on the same winding.

Odds are your manual will show connections in parallel for 120 Volts on the diagram. So don't let this confuse you.

In my owner's manual on page 29, Paragraph 6.7 see instructions for 240 V operation. I am guessing that you may be wired for 220 instead of 240 V operation.

Use should use a 4 amp fuse instead of a 6 amp with mains voltages over 200 v.

In the files section of this group is a article about a light bulb tester. " Save your transformer". Using this when testing the rig after changes will save the transformer from damage if a diode or capacitor that is faulty, or installed incorrectly. Also it will save the transformer if it gets mis wired or a solder bridge develops during soldering.

Subject: Re: [TS-520_820_530_830] TS-830S - HV, What is the Actual Voltage

Hi All,

I have checked our power supply to the house, and I get 236vAC, which is within the specs for our location. NZ main voltage is 230v, but I have never seen it actually be that.
I am using a Fluke 23 , as well as a Chi DV Meter, both read within 1v of each other, so I guess they are reading about the same. Both meters are speced for 1000v, and putting the leads across the HV I got 915, and 915.6v.
I could borrow one of the companies meters where I work, being a Steel Mill they have the heavy equipment to use and monitor.

I will change the diodes out, and I ordered new 500v capacitors to get my safety margin back up there. The radio is removed from mains until I get them.

Between the front panel meter and the DVM, I am happy with the readings from both, taking into account the front panel meter is not down to the last fraction of a volt.

Thanks

Subject: Re: [TS-520_820_530_830] TS-830S - HV, What is the Actual Voltage

Kevin.

You have gotten some good comments back on the High Voltage. I had the same problem as Ron - high line voltage to my house. You definitely need to measure your line voltage so you know what you are dealing with. I use a filament transformer connected in the "buck" mode to reduce my line voltage down to 115VAC for all my old Kenwood and Collins equipment. I just went and checked my 520 and 830 to see what high voltage they indicated on their meters with 115 VAC input. This was done in the SSB mode with the load being the tube idling current of about 50Ma. One indicated 840vdc and the other indicated 850vdc. Without the reduction in my line voltage, they would be running about 900vdc.

If you want to really know what the voltage level is, you will need to use an accurate DVM and make measurements inside the radio, or follow Walt's advice and change out the resistors in the metering circuit, because resistor values do change with age. Mike also raises a valid concern about exceeding the voltage rating of the capacitors.

Subject: [TS-520_820_530_830] TS-830S - HV, What is the Actual Voltage

Hi All,

Sorry to be here again, on the same area, the HV line.

I had got my radio back up and running after replacing the Filter capacitors as advised by this group. This worked out, and the radio is back operating.
I have however another concern. The HV line, from the manual, and by this group say the HV line should be 800v. Mine is putting out 915v. It is working all right, get it to load good, and I get good power out, by the external meter reading.
Am I looking too much into this? Or is this too high, and I have another problem? I can't see any control to lower this voltage.

Again thanks in advance.

11439. Substituting tube rectifiers with diodes.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-13 21:13:46 UTC
From: n9wb
Topic: 11439 Message: 11439

Substituting tube rectifiers with diodes:

When replacing rectifier tubes with diodes, a resistor with a minimum value of 10 ohms and a rating of 1/2 watt should be installed in series with each string of diodes. This is usually placed in series with the transformer leads to the rectifier. This softens the in-rush current but more important, these will open if the diode string shorts saving the transformer.

For transmitters where more than one amp is involved, it may be necessary to adjust this resistor value accordingly.

If the increased voltage output is considered a stress problem, it seems that a resistor resembling the internal resistance of the original tube could be used. Another idea would be to find a zener diode that has a voltage equal to the desired voltage reduction and sufficient current rating. This could be placed in series with the diode string with the cathode toward the load. (output). This would provide a more regulated drop than resistors. However still use the 10 ohm 1/2 watt resistor in series with the transformer leads that feed the diodes for protection.

Subject: [TS-520_820_530_830] Buck Transformer (or Boost) for less than optimum Mains Voltages

One of the most prolific and best technical discussion groups I ever engaged with (besides this one)is a group that worked on the R390A receiver. For those of you who are not familiar with this RX, it is a 500KHz (KCycle) to 32MHz (MCycle) general coverage RX originally developed by Collins for the military. Is was the 2nd Mark of the family and was all tubes. It was produced by numerous contractors from Collins and Motorola to (allegedly) Helena Rubenstein (though no one has ever reported seeing one from that company).

It was, and still is, a standard by which other RXs are judged and for a tube rig was famous for its stabilty and performance. It was extensively used in the Vietnam era and it is a piece of cold war legend. Several of these were on the ill fated Pueblo that N Korea captured. Rumor has it that these were to be destroyed in the event of capture (but the Pueblo crew didn't have the time) and that general in service, many were alleged to have been rigged with some type of explosive just in case of capture. I could go on but I need to get to the point of this topic.

The R390A is not for the faint of heart as a casual hobbiest RX since it is big, heavy, and dissipates a lot of heat. Two of the tubes in that beast are rectifiers and a Naval field upgrade was to remove them and replace them with Silicon rectifiers with a resultant rise in rectified voltages throughout the RX. This stressed all of the components with higher dissipation and higher voltages applied, but the Navy figured it was worth it.

Many R390A restorers are actually going back to the tube rectifiers to unstress their rigs but the extra heat generated from the rectifiers, in my mind isn't worth it. A better way to reduce the stress on the circuitry is to reduce the input voltages applied and some use variacs mounted along side their R390A. Another way is by using a voltage buck transformer either mounted inside the RX or as an adjunct to it.

For references on the transformer circuit used, just google 'R390a buck transformer' and a few references will come up. However, here is a good link to see the R390A in its glory, and at the bottom of the site is a link to compensate high voltages. Also, in case someone has a low voltage condition, the buck transformer can be configured in opposite polarity to boost the mains voltage.

http://www.r-390a.net/

If you think the Kenwood Hybrids are a gas, I recommend you keep your eye out for an R390A in reasonable condition. Your appreciation of tube electronics will go up exponentially once you start dabbling in these things. They make the TS-830 look like a piece of cake.

Best regards and Merry Christmas to everyone.

Subject: Re: [TS-520_820_530_830] TS-830S 236 volt mains.

In summary, since the filament voltage is well within spec, I don't think you have any issues except for the need for more voltage head room on the filter caps. however it was good to visit possible other issues.

I didn't want to cause you to panic, but I wanted to be sure that you did not have a shorted turn on the transformer primary. Fortunately, you don't since the 12.6 is very well within spec. The 850 to 855 volts with load is not really that high. The additional increase under no load is probably due to the increased storage capacity of the 150 uf caps.

I would probably trust the Fluke over the multimeter in the rig. Choosing 680 K and a 100 K resistor that is very close to these values in tolerance should improve the multimeter accuracy. So when you get the new caps, you should have a good healthy rig. Be sure to use a 4 amp fast fuse for protection since your mains voltage is higher.

Hope to hear you on the air.

Subject: Re: [TS-520_820_530_830] TS-830S 236 volt mains.

OK,that eliminates one concern. What is the plate voltage when you are tuned up full tilt on CW ? Does it drop a lot? Also, you might want to check the screen voltage. This is available at a point labeled SG on the final board.

On the transformer there is a tap labeled 12.6 and a adjacent tap labeled 0. This 0 tap goes to chassis ground. With the tube filaments on what does the 12.6 tap read to ground on AC volts ?

KM) - The 12.6vAC no-load is reading 12.76v, under load when Send is pressed, it drops to 12.66vAC, so I would expect this reading to be okay.

There are a couple of things that concern me about this high plate voltage, some good, some bad. I will explain more when I see the above information.

Each of the filter capacitors have 470 K bleeder resistors across them. These should be checked or just replaced. If you check them, be sure to let the rig set for a while and then short across the capacitors before connecting your ohm meter. Putting a clip lead across each capacitor for a few minutes will fully discharge them. A charge in them may damage your ohm meter.

KM) - I replaced the resistors and the 2x .01uF caps that go across the filter capacitors. The orignal resistors were okay, but seeing how they were wrapped around the filters caps, I decided to just change everything for new. The .01 caps should not go, as I only had 1500v ones, so used these.

These serve two purposes. First, they slowly discharge the caps when power is off for personal safety. Second, they provide a bit of balance between the capacitors when there is a low load on it. If they went very high in value, I suppose that they might allow the unloaded voltage to go higher than normal. That is one of a couple of reasons that I am interested what the rig's HV meter reads on SSB no Audio compared to 100 watts or so of CW output.

KM) - Checking the HV meter, and I also used my Fluke.

Under no-load, the fluke was reading around 915vDC, under load, with send switch on, this dropped to 855vDC, the meter was reading around 850v. So again, this appears to be operating correctly.

If the high voltage is just a bit high and the capacitors are rated at a high enough voltage to deal with it, that in and of itself will not be a problem. It will just give you a bit more power. However, if the filaments are running high and the 14 volt buss is running high, that might be troublesome.

Guess then, with the information you have supplied, and the information returned from your questions, is that the radio appears to be operating as it should. Voltages are within required specs. In my case, the filter caps were the reason for my non-working TS-830.

Again, Thanks for you continual help and patance over this matter.

An excelent Elmer!

You should check to see if your transformer is set correctly. I don't believe that your TS-830 has a 120/220 switch on the rear panel. It is possible that the primary on the power transformer is wired wrong. On the primary side of the power transformer you will see two sets of taps labeled as follows: 120, 100, and 0.

With your mains voltage the transformer should be set as follows:

The windings are connected in series and in phase. There should a jumper between the 0 terminal on one winding and the 120 terminal on the other.

Then one wire from the mains (on off switch) should connect to the remaining 0 or 120 terminal. Another wire from the mains (fuse holder) should connect to the other remaining 0 or 120 terminal. So you have a series circuit. One mains wire goes through the switch and into winding #1. The circuit then comes from the other end of winding # 1 and goes into winding #2 by way of the jumper. The circuit then comes from the other end of winding # 2 to the mains wire through the fuse.

What you need to look for is whether either of both of the 100 terminals are being used instead of the 120.

Now where this will get tricky is that there will be a connection from one of the 100 terminals for the fan. Tell me what you have and the wire colours. I will suggest what to do if anything.

Disregarding the fan connections, If both 100 taps are used instead of the 120 taps, the rig is wired for 200 V. If one 120 and one 100 tap are used, the rig is wired for 220 volts. If both 120 taps are used, the rig is wired for 240 and that is what you want.

Before changing anything tell me what you have. It is very important that these windings be kept in phase. If changes must be made, the jumper should not be removed from it's 0 tap. If it goes to a 100 tap instead of a 120 tap, then only that end of the jumper should be moved to the 120 tap on the same winding.

Odds are your manual will show connections in parallel for 120 Volts on the diagram. So don't let this confuse you.

In my owner's manual on page 29, Paragraph 6.7 see instructions for 240 V operation. I am guessing that you may be wired for 220 instead of 240 V operation.

Use should use a 4 amp fuse instead of a 6 amp with mains voltages over 200 v.

In the files section of this group is a article about a light bulb tester. " Save your transformer". Using this when testing the rig after changes will save the transformer from damage if a diode or capacitor that is faulty, or installed incorrectly. Also it will save the transformer if it gets mis wired or a solder bridge develops during soldering.

11443. Line voltage to shack

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-13 22:03:33 UTC
From: Rich Jones
Topic: 11443 Message: 11443

My line voltage to the shack is 123.9 volts. Are you saying I am putting my TS520 and 530 in jeprody? Your advise is very much appreciated. Thank you, Rich KG7FS in Michigan

It doesn't seem to be in all of them Old Pal. Not in the '88 or'92.
I can't see it in any of the RSGB 'Handbooks' although I do recall it
somewhere in 'Tech Topics' from waaaaaay back.

The important bit is that the Secondary rating of the Tranny MUST be
greater than the expected load -, so for the purposes outlined here -
at least 5 Amps.

It [the tranny] does not of course have to be of a fixed voltage - the
'42 edition does in fact say a tapped tranny - which could give quite
a small, and variable 'adjustment' along the lines of a cheap Variac.

No, you're not. I've run 520s, 820s and my three 830S anywhere from 100 volts to 140 volts and they don't have a problem.

11446. Filters

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-13 21:53:23 UTC
From: boat.anchor
Topic: 11446 Message: 11446

In with some bins of parts I picked up are a number of filters. I am curious if they would be of any use to me in my Kenwood Hybrids or should I pass them on to someone who could use them. They are as follows:

Kristall-Verarbeitung
Neckarbischofsheim-GMBH
QUARZFILTER
One XF-9C and one XF-9B10
These are both 9Mhz filters.

MuRata Ceramic Filter Type CFM-455E
There are 5 of these each labelled with a number that I can't find any reference to.
0049, 3412, 3497, 3514, 5802

I do have the data sheets available in PDF if that would assist in soliciting advice but I am completely at a loss to understand what I am looking at. There is not enough space for me to upload to Files.

Thanks very much
Barry

11447. Filters

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-13 21:58:03 UTC
From: boat.anchor
Topic: 11446 Message: 11447

There is another component the same size and shape as the muRata filters that is labelled
MCL RAY-3 OC 383

Any suggestions on this. There is some Collins parts in this assortment if that helps.

thanks
Barry

11448. Re: Substituting tube rectifiers with diodes.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-13 23:36:27 UTC
From: Larry Shorthill
Topic: 11439 Message: 11448

Walt,

Yes, limiting inrush current is something to think about in these old rigs and a filament heated rectifier would certainly do that. Rectification would not occur until the rectifier filament got hot and that would take 30 seconds or so. Resistors in series with the diodes would do this as well, but would negate some of the heat reducing benefits of moving over to the Silicon rectifiers.

In the Naval order for the Silicon rect. modification to the R390A, they did not put a resistor in series with the two rectifier diodes, but they did at one time have a couple of voltage dropping power resistors added into the audio module to limit the high voltage in the box. The problem with that scheme was that the audio modules ran hot anyway and the extra heat just cooked the audio section. The other problem was in substituting modules in inventory. As long as all the power supply modules were modified for the silicon rectifier, then they would work with all audio modules in inventory. However, if an audio module had been modified with the extra power resistors, then they would only work adequately with just the modified power modules. Quite a juggling act it would seem.

Oh, and one other thing about this mod from the Navy -- they had the tech doing the mod crush the tube socket skirt so a tube couldn't be installed in that position. Backing out this mod requires installing two new tube sockets unless the socket skirt could be bent back into reasonable shape.

Other schemes such as installing dropping zeners may keep the voltage stress down but the heat is still dissipated. Lowering the line voltage by 5 to 10 volts or so will keep the heat out and it will keep the voltage stress lowered as well.

The R390A internet group spent many hours of discussion about whether the mods should be backed out so that inrush wouldn't cause an issue, so that filiments would heat slowly, etc. The bottom line was that everyone had a different standard from complete NOS restorations to those that modified at will to remove the rectifiers and filament ballasting tubes, etc. Most of us were content to leave the basic modules the way they were originally designed, modify them with improved capacitors (mostly Sprague Orange Drops, or other high quality Plastic film types)so they would work reliably, and install devices that plugged in the place of the rectifiers and the ballast tubes. In this way they could easily work either way with minimal cosmetic changes. Extra holes and cutouts were discouraged, etc. for future buyers and historical reasons. Bringing an R390A alive with a

variac is an inherently slow, current limiting approach, but there are other ways, such as PTC resistors installed inside the chassis in the line leads, etc. to limit inrush without detracting much from originality.

By removing the ballast and rectifiers and having other means of inrush and voltage limiting, it is possible to take quite a few watts out of the box. With small muffin fans to move and cool air and modern capacitors, these old radios are likely to see many years more service. Many of these ideas and techniques can easily be applied to Kenwood hybrids and to some of our other radios for that matter. I really like the idea of installing small muffin fans or small CPU cooling fans in order to cool areas that don't get much airflow. Heat is the enemy of most electronics. Lessons learned from other groups (and I encourage everyone to read through many of the old message threads on the R390A, etc.) are just as valuable here.

Seeing the buck transformer written about and hearing that many didn't know what it did brought back a lot or rememberances of working on the R390A projects.

Thanks for all your inputs Walt. This is by far the best Yahoo forum by far that I subscribe to.

Cheers
Larry

>
> When replacing rectifier tubes with diodes, a resistor with a minimum value of 10 ohms and a rating of 1/2 watt should be installed in series with each string of diodes. This is usually placed in series with the transformer leads to the rectifier. This softens the in-rush current but more important, these will open if the diode string shorts saving the transformer.
>
> For transmitters where more than one amp is involved, it may be necessary to adjust this resistor value accordingly.
>
> If the increased voltage output is considered a stress problem, it seems that a resistor resembling the internal resistance of the original tube could be used. Another idea would be to find a zener diode that has a voltage equal to the desired voltage reduction and sufficient current rating. This could be placed in series with the diode string with the cathode toward the load. (output). This would provide a more regulated drop than resistors. However still use the 10 ohm 1/2 watt resistor in series with the transformer leads that feed the diodes for protection.

(The Technical Manual shows 110V or 120V), if your rigs are set on 110V, then you have 10% over volts, not a good idea for lamps and filaments. If they are set on 120V then it's a small overload. Thirty years in Broadcasting persuaded me and my fellow engineers that slightly underrun gear was more reliable than overrun.

In the retail trade you some times get a set that had all it's tolerances set in one way, so you get a 'sparkling' but unreliable TV, or a 'dull' but reliable TV. We used to try to get the 'sparkling' set in to the Fringe Areas where we needed all the gain, the pay off was we would be visiting that set more often!

Have you got a 12V txformer in your junk box with about 5 to 6 amps output, that could feed both rigs. You only need one txformer to feed the shack, providing it's secondary has a high enough current rating.

My son-in-law is and engineer for the national power distribution company, you should see the buck and boost txformers that they use. The size of a large house, completely automated, (until some thing goes wrong). They can be upto 400 KV, and carrying Giga-watts.

Topic: 11337 Message: 11453

Greetings to both and thank you for remembering me. I posted back about the forth of this month and then found the clock on ebay and bid. I won the bid and it's on it's way here now via USPS.

At the time I won the bid and paid for it I made a second announcement about finding the clock as our group prefers it be handled properly.

This clock is an accessory to the TS-520 but also to other tube hybrids, thus a match to a station layout. I build one piece at a time basically and have been planning this layout for years.

The clock was in very good shape with few scratches or marks.

I used a r-390a in my high school amateur radio club. I remember how it performed. amazingly well. We had it rack mounted. I went thru other radios then but found nothing like the r-390a. Till that point ,y favorate was the SX-99. After that the r-390a stayed top of my list till I got my 830, which I've had for years.

The front panel has an amazing outlay of gears behind it and to use one is the feel that nothing else of those times comes close.

Band swictching was just as amazing as the tuning of stations.

Thanks for the reminder.

I would like to add another comment.

It is my personal belief that all equipment should be turned off when not in use. for example, overnight or when leaving home as opposed to leaving the rig for an hour of so for dinner or a phone call. this is particularly important with older gear. Among many other things, this will reduce heat damage.

Some people will argue that gear is best left on 24/7. I just cannot agree with that. And particularly not with vintage gear.

The R390A internet group spent many hours of discussion about whether the mods should be backed out so that inrush wouldn't cause an issue, so that filiments would heat slowly, etc. The bottom line was that everyone had a different standard from complete NOS restorations to those that modified at will to remove the rectifiers and filament ballasting tubes, etc. Most of us were content to leave the basic modules the way they were originally designed, modify them with improved capacitors (mostly Sprague Orange Drops, or other high quality Plastic film types)so they would work reliably, and install devices that plugged in the place of the rectifiers and the ballast tubes. In this way they could easily work either way with minimal cosmetic changes. Extra holes and cutouts were discouraged, etc. for future buyers and historical reasons. Bringing an R390A alive with a variac is an inherently slow, current limiting approach, but there are other ways, such as PTC resistors installed inside the chassis in the line leads, etc. to limit inrush without detracting much from originality.

By removing the ballast and rectifiers and having other means of inrush and voltage limiting, it is possible to take quite a few watts out of the box. With small muffin fans to move and cool air and modern capacitors, these old radios are likely to see many years more service. Many of these ideas and techniques can easily be applied to Kenwood hybrids and to some of our other radios for that matter. I really like the idea of installing small muffin fans or small CPU cooling fans in order to cool areas that don't get much airflow. Heat is the enemy of most electronics. Lessons learned from other groups (and I encourage everyone to read through many of the old message threads on the R390A, etc.) are just as valuable here.

Seeing the buck transformer written about and hearing that many didn't know what it did brought back a lot or rememberances of working on the R390A projects.

Thanks for all your inputs Walt. This is by far the best Yahoo forum by far that I subscribe to.

Cheers
Larry

series with the transformer leads to the rectifier. This softens the in-rush current but more important, these will open if the diode string shorts saving the transformer.
>
> For transmitters where more than one amp is involved, it may be necessary to adjust this resistor value accordingly.
>
> If the increased voltage output is considered a stress problem, it seems that a resistor resembling the internal resistance of the original tube could be used. Another idea would be to find a zener diode that has a voltage equal to the desired voltage reduction and sufficient current rating. This could be placed in series with the diode string with the cathode toward the load. (output). This would provide a more regulated drop than resistors. However still use the 10 ohm 1/2 watt resistor in series with the transformer leads that feed the diodes for protection.

11457. Kenwood TS-830 Front Panel

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-14 07:18:00 UTC
From: court
Topic: 11457 Message: 11457

Hello folks,'
wondering if anyone out there has a MINT condition front panel they no longer need, Im trying to refurbish my old radio , it must not have any wear on it or marks of any kind.
Maybe someone has a dead TS-830 around somewhere it would be nice to obtail one.
Thanks in advance

cheers
Courtney

11458. TS-530S manual

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-14 05:40:12 UTC
From: martin
Topic: 11443 Message: 11458

Hi All. IS there anyone who has the Operation manual for the TS-530 (NOT the TS-530SP/D) in electronic format? Or does someone know where I can download this manual? I have the TS-530SP/D manual, and the service manual that covers all three (TS-530S, 530SP, and 530D). I would very much like to have the Operation manual for the TS-530S. If someone has the manual in good condition, and could scan it in high res, I would grateful. Best option would probably be to write it to CD-R disk and send it through the mail. I will gladly pay for the cost of the disk, padded envelope, paper disk envelope and first class postage. This should run about $3.00.

Thanks.

11459. Re: VFO cable

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-14 05:38:00 UTC
From: the_tick_lives
Topic: 6438 Message: 11459

Well, the good news is that I found the connectors. They didn't have the cable shells, but did have a number of them, and they were here locally in St. Louis! So now all I have to do is get the soldering iron out!

How critical is having the signal line from the radio to the VFO sheilded. I have not looked at the schematic to see what the frequency that is carried over the cable.

Worst case I'll use some microphone cable for the signal and another cable for the other leads.

11460. Re: [TS-520_820_530_830] Line voltage to shack

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-14 08:18:02 UTC
From: n9wb
Topic: 11443 Message: 11460

With the TS-520 on page 51 of the service manual is the transformer wiring. Most likely it is wired for 120V. So you are probably OK with 124 V. However, if you ever decide to run it on 240 V (248 volts) You want to be sure it is wired for 240 V and not 220 V.

A good check is to measure the filament voltage with the filaments on. You need not be transmitting. Find the transformer tap labeled 12.4 or 12.6. Measure the AC volts from this tap to chassis ground. If it is below 12.8 you are OK. You can even fudge a bit more.

With the TS-530, on page 35 of the operating manual you will find the transformer wiring. It is probably wired for 120V. However the 220 side is probably wired for 220 and not 240. If you decide to run it on 240 V (248 in your case) be sure that the transformer is wired for 240. Again, with the filaments on measure the AC volts between the transformer tap labeled 12.4 or 12.6 and ground. If it is less than 12.8 you are OK.

If you need to change taps and need assistance, let us know. Also, let us know what filament voltage readings you are getting.

My line voltage to the shack is 123.9 volts. Are you saying I am putting my TS520 and 530 in jeprody? Your advise is very much appreciated. Thank you, Rich KG7FS in Michigan

Sorry, sorry I forgot that you are 9 Amp+ per Kilowatt, not 4.2 Amp of our supply, so that line should read 10 to 12 Amps.

Blimey, you must have some copper in your house wiring!

Subject: Re: [TS-520_820_530_830] Line voltage to shack

(The Technical Manual shows 110V or 120V), if your rigs are set on 110V, then you have 10% over volts, not a good idea for lamps and filaments. If they are set on 120V then it's a small overload. Thirty years in Broadcasting persuaded me and my fellow engineers that slightly underrun gear was more reliable than overrun.

In the retail trade you some times get a set that had all it's tolerances set in one way, so you get a 'sparkling' but unreliable TV, or a 'dull' but reliable TV. We used to try to get the 'sparkling' set in to the Fringe Areas where we needed all the gain, the pay off was we would be visiting that set more often!

Have you got a 12V txformer in your junk box with about 5 to 6 amps output, that could feed both rigs. You only need one txformer to feed the shack, providing it's secondary has a high enough current rating.

My son-in-law is and engineer for the national power distribution company, you should see the buck and boost txformers that they use. The size of a large house, completely automated, (until some thing goes wrong). They can be upto 400 KV, and carrying Giga-watts.

If this is a VFO for a TS-830, pin 1 should definitely be shielded. This pin is the VFO RF output.

This VFO sends 5.4 to 6.1 MHz through pin 1.

The shield itself should connect to pin 7 at each end. I would recommend miniature coax such as UG-174. A source of miniature coax is a olde cell phone remote antenna. The other wires can be something you can find and do not need to be shielded.

A microphone cable will probably also work if it has a good shield. the impedance is not critical. A straight multiple conductor mike cable with a good shield around an individual wire would work neat.

I have been running my 820 with the VFO-820 without shielded cable
for a long time with absolutely no problems, even with 600 watts
running through the coax within 2 inches of the VFO cable.

11466. RE: [TS-520_820_530_830] TS-530S manual

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-14 19:38:19 UTC
From: Geoff Hegarty
Topic: 11443 Message: 11466

Hi Martin

I have just emailed the 530S User Manual pdf file to your personal address.
i tried to load it into the group's files, but was told that there wasn't
enough space. Hope you get it OK.

I downloaded this version from the web, but I can't remember where I got it
- I'll do a bit of searching at the weekend and try to find my original
source.

Regards
Geoff VK2HQA

I have a .pdf of both the operating and service manual. I will check
the size and see if they can be uploaded. If there is enough interest
I can put all the manuals on CD and mail them out to those who want
them. I have most of the service and operating manuals for most of the
Kenwood gear.

Max

Max,
I would be interested in getting them for my Kenwood Manuals site.

You can email them to n6wk_skcc3@... if you find the time and I
will post them on my site.

11469. TS-820S Excessive Idle Current Follow Up

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-14 20:28:18 UTC
From: k8wvg
Topic: 11419 Message: 11469

Inspection of the rf board under high magnification showed one end of R13 having a very narrow light gray ring on the resistor body around one lead. A check with an ohm meter in circuit and with one end lifted shows R13 to be open rather than the specified 82K ohm.

R13 and R14 form a bias voltage divider for the 12BY7 driver. Will replace R13 and see what happens.

11471. Line Voltage Adjustment Text.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-14 23:46:31 UTC
From: Another Old Codger
Topic: 11471 Message: 11471

Here is the Line Voltage Adjustment Text from the ARRL 1985 Handbook, (Circuit in the Photos Section) :-

Some communities experience trouble from fluctuation in line voltage. Usually these fluctuations are caused by a variation in the load on the line. Most of the variation comes at certain fixed times of the day or night, such as when lights are turned on at evening, so it may be taken care of by the use of a manually operated compensating device. A simple arrangement is shown in 2A. A tapped transformer is used to boost or buck the line voltage as required. The transformer should have a secondary varying between 6 and 20 volts in steps of 2 or 3 volts, and its secondary should be capable of carrying the full-load current.

The secondary is connected in series with the line voltage and, if the phasing of the windings is correct, the voltage applied to the primaries of the transmitter transformers can be brought up to the rated 117 volts by setting the transformer tap switch on the appropriate tap. If the phasing of the two windings of the transformer happens to be reversed, the voltage will be reduced instead of increased. This connection may be used when the line voltage is above 117 volts. This method is preferable using a resistor in the primary of a power transformer since it does not affect the voltage regulation as seriously.

The circuit of 2B illustrates the use of a variable autotransformer for adjusting the line voltage. Powerstat and Variac are trade names for these transformers. High-power stations can easily draw 20 amperes from the line, but variable transformers for this current are expensive. Fig. 2C shows how to adjust the voltage of a high current line using less exotic components.

Note from Ron, though the text talks about 117 volts, obviously the circuits can be used for any line voltage, subject to appropriate transformers being used.

Just keep watching ebay. Do like I just did, set into favorate searches the phrase "HC-10 clock".

It will send information to your email when one appears and give you a link to it. That way it does the monitoring for you.

I just got one of these clocks off ebay. I had a bidwar but won.

The clock is here as of tonight and it is in like new shape. Complete with manual.

So if you get yours and need some info remember to contact me.

watch the heat as your soldering those wires to the pins. I had mine to high and found they won't take much heat once. Be good and be quick.

the impedance is not critical. A straight multiple conductor mike
cable with a good shield around an individual wire would work neat.

11476. Re: Filters

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-15 01:59:32 UTC
From: boat.anchor
Topic: 11446 Message: 11476

Mike

Thanks. That is the same data sheet I have. It states both filters being good for ESB, SSB, & BLU. The SSB I will guess is single side band, either Upper or Lower. The ESB may be Extended Side Band, or Wide Band, but I am Blue in the face trying to figure out what is BLU.

The next issue is I don't understand enough radio theory to decide if these specs are good, bad, or indifferent.

If they are good should I be thinking considering how much better than my stock TS510, TS520, TS820 they might be if indeed they are a compatible replacement. Non of my radios have a CW filter and even though I don't do CW on occasion I have a guest over that does enjoy it. Might be nice to make one rig capable.

Confused in Vancouver

11478. TS-830s Screen Grid Switch Issue

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-15 02:08:22 UTC
From: w0ng@adelphia.net
Topic: 11478 Message: 11478

I'd greatly appreciate it if someone reading this posting might have an idea they would pass on to me as to why an otherwise good working Kenwood TS-830S transceiver literally goes "dark" when the screen grid switch is turned to the OFF position.

I was replacing a mismatched pair of finals (one 6146A and one 6146W) with a good pair of 6146B's. Started to begin the neutralization procedure by loading the xcvr up on 28.500 like normal but when I turned OFF the screen grid switch on the back panel the frequency display went dark and the SEND switch became inoperative (no relay action) along with all meter functions and controls.

Turned the screen grid switch back ON and everything returned to normal. Turned it OFF and again the display went dark, SEND switch was again inoperative along with everything else but the fan and indicator lamps. There was no measurable rf output from the driver stage on my scope when the screen grid switch was in the off position.

Really appreciate some help here as to why this is happening and how to fix it. If I haven't given enough background info, etc. let me know. Thanks in advance. Bill, w0ng@...

11479. Re: [TS-520_820_530_830] TS-830s Screen Grid Switch Issue

Bill,

You don't say how long you have owned this rig but, since you indicate
that the finals were of different types, I suspect you recently
acquired it. Am I correct? If I am correct that it is new to you
have you checked the wiring of the SG switch? Maybe a previous owner
did some "creative" wiring.

11480. TS-520SE Lining up Knobs

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-15 05:47:28 UTC
From: baumbrent
Topic: 11480 Message: 11480

I am now reassembling my 520 SE after having completed a 10 meter crystal transplant. However, I have a couple of stumbling blocks.

1. How do I correctly line up the pointer on the plate control. I know it should be pointing toward one end of the scale or other when the plates of the variable capacitor are completely meshed, but which end?

2. The hair pin spring on the chain for the center capacitor of the drive control seems to have lost its tension, allowing this capacitor to slip out of sync with the other two. It allows one-half to a full link worth of slippage. Is there a way to fix this?

Once I get these items fixed I'll dive into the transverter connection retrofit. I'll keep everyone posted on how that goes.

Thanks,
73, K7MEI, Brent

11481. Kenwood TS-830 Mods

Yahoo group: TS-520_820_530_830 (2006)

From: court
Topic: 11481 Message: 11481

Good day group,
Was looking on google yesterday, and came across something that looks quite interesting. Im wondering if anyone within this group have managed to have a mod done to their radio as it looks very interesting without having expensive EQ's that really dont work to its fullest with this kind of radio that we all know has more potential than we think and know these TS-830s can actually do. I will list these mods and would be intrested if anyone has attempted these at all. the List as follows.

1-EXPANDED TRANSMIT AUDIO MOD

Like the expanded receive mod, the transmit mod is usually done at the same time.

This enables the radio to transmit all of the audio that it should. The TS-830 is one of the last great sounding tube radios. Tubes will always sound better than solid state. Now let that TS-830 roar!

With this mod, the radio will transmit audio from 50hz to 3100Hz

2-UNLOCKED IF SHIFT/VBT MOD

The last and probably the most useful mod.

This mod unlocks the IF SHIFT and the VBT for transmit. It makes you sound like the station that you've tuned in. This is really advantageous when talking to a mobile. Mobile stations usually don't have many lows in their audio and your expanded transmit audio is just wasted energy to a mobile radio. This mod allows you to sacrifice your extended lows for extended highs where they will do some good for the mobile radio to hear.

Heil microphones and equalizers have been used for years in DX pileups because they cut through the background noise pileups. Now with this mod, you can instantly tailor your audio to suit your conditions. Better than a simple EQ, because with one knob, you can perfectly copy the other station, and at the same time make your signal a perfect copy for him to hear!

This should be designed into ALL radios with VBT/IF SHIFT !!

You would not believe what this mod does with the processor! Loud is an understatement.
You get volume and clarity without the grunge normally associated with processors.
No adjacent channel interference or clipping distortion either, just

loud clean audio.

If anyone has any thoughts on this or have had done or attemped this , could you please drop me a line and i will supply the web site where this could be done. Im sure there are some quite smart people out there that could actually have done this before so please some feedback would be great
Cheers
dr Courtney McCarthy

11482. Re: [TS-520_820_530_830] TS-830s Screen Grid Switch Issue

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-15 07:49:19 UTC
From: n9wb
Topic: 11478 Message: 11482

I would look at the wiring to the SG switch for obvious modifications. Also, place the rig in transmit, SSB, 0 mike gain and measure the voltages on the switch contacts. If the switch were open, the rig would be mostly operative.

If it were shorted, you would have blownfusen mit spittensparken and smellensmoken.

I bet it has been modified.

Subject: [TS-520_820_530_830] TS-830s Screen Grid Switch Issue

I'd greatly appreciate it if someone reading this posting might have an idea they would pass on to me as to why an otherwise good working Kenwood TS-830S transceiver literally goes "dark" when the screen grid switch is turned to the OFF position.

I was replacing a mismatched pair of finals (one 6146A and one 6146W) with a good pair of 6146B's. Started to begin the neutralization procedure by loading the xcvr up on 28.500 like normal but when I turned OFF the screen grid switch on the back panel the frequency display went dark and the SEND switch became inoperative (no relay action) along with all meter functions and controls.

Turned the screen grid switch back ON and everything returned to normal. Turned it OFF and again the display went dark, SEND switch was again inoperative along with everything else but the fan and indicator lamps. There was no measurable rf output from the driver stage on my scope when the screen grid switch was in the off position.

Really appreciate some help here as to why this is happening and how to fix it. If I haven't given enough background info, etc. let me know. Thanks in advance.

Hello all.
Just a quick note to the group regarding Yaesu Microphones with the 830s.
Currently i have run many Yaesu microphones with the 830s I find the MD-1c8 is the best match, far better than any kenwood mics that i have tried as far as audio goes.(You can listen to my audio file in the files part of this forum Court3.wma).

Has anyone out there attempted to run the ultimate Yaesu MD-200 studio mic on the 830? Always wondered if the ultimate mic would drive the 830s ok ? Maybe someone has come up with a audio box (*im not talking about the w2ihy*) as i have tried that unit with no sucsess,as it just does not pass past the Front end and do the audio any justice.

There must be someone out there that does not want to spend a fortune on the new DSP radios and use the 830 , as everyone knows the 830 has fantastic audio hands down, sometimes better than the newer radios including the yaesu mark 5 ! anyone worked out an external audio tailoring unit , i know it would be a home brew, if so Put me down for one , Id be happy to purchase one if someone has come up with a fantastic product (excluding the W2IHY).. Id like to run even a Behringer B1, some real studio mics would be fantastic.

Merry christmas guys , scratch your brains people and offer some great ideas for us .
cheers
Courtney

I have sent you invitations to KenwoodMics, astaticmicrophones, KenwoodQSO. If you are into mikes, here is the worlds coolest site. http://www.coutant.org/
Go to n9wb.org or the files section of KenwoodMics or astaticmicrophones find an article on improving D-104s.

Max and I are working on using an Electret element in a D-104. We don't have it debugged quite enough to publish it yet. One version has a adjustable boost in the presence area.

I rather like some of the rack gear that is being used and I am IHY friendly. However, I like to build my own audio gear. I am presently working on a EQ-processor that uses FETs.

To EQ studio mikes, a variation of the Heil EQ 100 or 200 works well. Get rid of the 741 op amps and use TLO 70, 80 series.

Let me what mods you were asking about in the previous post. We have some that are not radical.

11487. [TS-520_820_530_830] Pesky S-Meter (TS830)

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-15 15:36:28 UTC
From: Ron Hauser
Topic: 9948 Message: 11487

Hi Rick, long time no troubleshooting on this S-meter problem. I recently started correspondence with Tim KA9EAK who reports a similar problem. I took a break from this effort and now that I have some vacation time coming up for the holidays I am revisiting it.

Summary: The symptom is a "dead" S-meter response, the S meter only responds to very big S9++ signals. I tried the S-meter calibration procedure in the operators manual but that did not provide additional sensitivity. I then started testing voltages on the IF board around Q11, Q12 and found that the AGC line that is supposed to be 2.9v at Q11 is low (1.12v). This same low voltage is seen at the plug #15 wire 3 from the RF board., and on over to Q1 on the RF board. Measured(nominal): 12.09(12.4), 0.99(1.0), 0.86(2.7), 0.68(1.1[-2.9]). I tested quite a few components in that area and didn't find anything taking this signal down, so I worked back the other way and measured voltages around Q9 and Q10 on the IF board. Again I have some discrepancies from nominal, I tested a bunch of components but didn't find a bad one. I also verified the 9.0v and 3.6v supply, and deoxit-ed board connections.

At this point I have a lot of measurements and I have tested quite a few components, but I am not finding the problem because I lack basic understanding about the radio design. I possibly also lack understanding of electronics (!) as I've only been a ham for two years. Probably I have too much data. And not enough critical thinking.

Something is pulling the AGC line down from 2.9v to 1.12v and I'm getting stuck (but I am having fun poking around in the radio, reading the schematic, and studying the manuals). Rick, or anyone else, got any ideas?

Thanks!!!

Subject: RE: [TS-520_820_530_830] Pesky S-Meter (TS830)

Hi Ron,

Yes, I had a shorted ceramic but it wasn't a dead short. It had about 3k resistance if I remember right so it pulled the circuit down but not enough to make it quit all together. Have you checked the voltages on your AV-AVR board to make sure you have exactly 3.6v and 9v? I would check the by-pass caps, There aren't that many of them nor are there any other ground paths in the AGC circuit so you may be able to check resistance with out lifting them.

Lamar, Colorado

Ron Hauser <eichmann@...> wrote:

Ok we are getting somewhere now. I do _not_ have the 2.9v on the AGC line
coming into the IF board (0.00v). Likewise 0v on the RF board connector #5
pin 1. Working back to Q1 on the RF board, 0 volts on this same lead,
supposed to be 2.7v on the schematic. When you said you had a bad disk
ceramic shorted to ground, was it the C45 right here? Unless a better
recommendation appears I'll lift C45 and R12 to test...

To: Ron Hauser
Subject: RE: [TS-520_820_530_830] Pesky S-Meter (TS830)

Hi Ron,

OK on the voltages ...I would pull the wire plug off of connector #15 on
the IF board and check pin 3 on the plug. . This is the AGC line that brings
the 2.9v onto the IF board. If it checks out for 2.9v then somethng on the
IF board is dragging it down. If it is still 1.12v, than the problem is NOT
on the IF board. The AGC line comes from the RF Board (connector # 5 pin 1).
I am sending a shot of the RF board.... I had a bad disc ceramic capacitor
one time that was shorted ...Drove me nuts until I finally found it.

The AGC line on the I F board goes to Q4, Q8 and Q10 plus Q11 and Q12 that
you already checked. I would check the bypass caps off the transistors the
AGC line goes to and C177 and C184 on the end leg of the AGC to the left of
Q31

We having fun yet?

73' Rick KC0HH
Lamar, Colorado

Ron Hauser wrote:

Hi Rick, thanks for pointing me to Q11 and Q12 on the IF board... I had
"almost" figured out that is where I want to look.

First I checked the TX/RX relay contacts, and gave them a cleaning with a
piece of paper and some Deoxit. It was looking very bright and shiny when I
opened it up, and I did not get a change in behavior.

Next I checked voltages around Q11, Q12. The supply to R73 and Q11 is 8.98v
(ok). The three leads of Q12 are 0v (ok), 4.24v (4.3v specified as nominal)
4.87v (4.8v specified). That seems pretty close. The two leads of Q11 were
5.92v (5.7v specified), and 1.12v (2.9v specified). That seems to be a
problem.

I also checked the resistors around VR2, VR3. I pulled R72, R73, R74 off
the board but all checked out within tolerance. Interesting note, the
schematic has an error, it has R92 as a typo for R72, that was a nice bit of
confusion.

I'm thinking that I'm onto something with the values around Q11 but now I'm
back to poring over the schematic trying to decide where to go next.

BTW, When I go through the calibrate procedure for the S meter I never get
more than S4 as the biggest peak on the calibrator signal.

Thanks for the help, and any more ideas will be welcome!

Thanks for the suggestions. Yes, I did just acquire this particular radio. This model radio was one of the first HF xcvr's I acquired when I got into ham radio some 25 years ago. Always regretted selling it. I intend to keep this one. Great cosmetics and really clean inside. Nothing burned or abused.

Of course the seller (private sale from a ham) said it had recently been "serviced" by a qualified repair shop (?). So far I haven't discovered any hacked wiring or odd-mods, just the mismatched finals.

I'll definitely look at the SG switch wiring to make sure it hasn't been tampered with. I'll let you know what I find.

Hi Rick. I know some TS-530S rigs had a similar problem. Was caused by high voltage surges from the antenna, and Kenwood issued a bulletin with a fix. Not sure itf this is applicable to your TS-830.

You might go to http://www.k4eaa.com/index.html, and email Ken. Since he services and restores Kenwood hybrid radios, he may be able to give you an idea of where to look.

Good Luck!

11490. Re: TS-820S Excessive Idle Current

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-16 03:41:11 UTC
From: k8wvg
Topic: 11419 Message: 11490

I decided to go over the rig with a fine tooth comb prior to testing out the R13 bias resistor repair on the rf board. Measuring the final cathode resistors I found them to be actually 20 ohms instead of 10 ohms each (they are color coded as 20 ohms). They also appear to be 2 watt or better units.

I'm the third or fourth owner of this rig so someone had replaced the (probably failed) 10 ohm resistors with 20 ohm, 5 watt ones. As Ip is measured via the drop across these resistors, I had been operating the rig at incorrect idle and power for quite a while.

Is replacing the 10 ohm cathode resistors with higher rated 20 ohm ones a recognized mod for the TS-820S? If not, 10 ohm ones are going in as fast as I can heat the iron up.

Definitely, DO NOT up the wattage of the cathode resistors. That's your failsafe if something major goes amiss. They open instead. I've got three 530s that previous owners "modded": one with a smoked power transformer, one with power amp tubes that literally have holes melted in the glass envelopes, and one with the power amp circuit board turned to charcoal. All three resulting from diddling with the component values.

Higher values is like putting a higher rated fuse that keeps blowing. Sure, the fuse is less likely to open, but you can bet that whatever it's designed to protect will eventually smoke. Put 'em back to original spec, and find the real cause for the problem.

Topic: 11481 Message: 11492

Hi,

I have just been to the web site listed below. Interesting the Mods he has posted.
Interesting the price he charges for the mod to be carried out :(
Understand that he is in the business of servicing and electronics, however his prices put the cost way beyond the price that the radios are worth.
In my case I paid NZ$400 (US$260 approx), and at around US$430 (NZ$640), pointless, and that doesn't take into account the cost of shipping it to him, and back, another few hundred dollars.
And it does not appear he supplies the information on his pages for us to do ourselves, very sad. One would hope that in the spirit of Ham Radio this information would be freely available.

Anyway, if I could get the information, it would be nice to try. Not interested increasing the output power, if I want to do that I'll get a amp.

Anyway, that's my thoughts on the matter.

Kevin, ZL1KFM.

Hi,

Was wondering what the differences are between the Standard and Gold models
of the TS-830S?
Also, how does one know which model one has? Is there any visual aspects on
the radio that make it stand out, and easy to identify?

Regards

Well, it's a new month.

But, in order not to repeat it all, go to the TS-520_820_530_830@yahoogroups.com site main page; scroll down to the title "most recent messages"; look to the right and you'll see a "Search" Box. Put the word "gold" in the Box and click Search. You'll find approx. 290 comments referring to "gold" The majority of them will answer your question numerous times.

There is a wealth of information in the search archives. There's been a lot of discussion since 2002. I didn't add up the monthly numbers but there have been thousands of posts.

TS-820
Heat up the iron !

That is a very bad mod. The resistors should total 5 ohms (2-10 ohm in parallel) and it is important that they NOT be increased in wattage. The also must not be wire wound. These resistors act as a fuse, a meter shunt, and cathode grounding. Increasing the ohms will throw the meter and the linearity off, increasing the wattage will cause increased damage if a tube shorts, and using wire wound will insert inductance in series with the cathode. So use 10 ohm at 1 watt Only.

While you are in there, check R-5, R-6, and R-7 on the HV board. They often change value and mess with the screen bias.

Also, if R 13 on the RF board was open, this might have been caused by a plate to screen short in the 12BY7. You may also want to check R-14 to be sure it has not changed in value.

I would also recommend going to the files section of this group and read the article "save your transformer". This is a device that uses a light bulb in the live power line to reduce damage if there is still a problem. Be SURE you have the correct fuse, 6 amp for 120 V 4 amp for 240 V.

From: Ruben Echevarria
Topic: 11493 Message: 11498

The only difference between the "GOLD" and "SILVER" models is that the "Gold" has 1 bulb for meter
illumination and the "Silver" has 2 bulbs. Also alllegedly the "Gold" has all the filters installed at the factory
whereas the "SILVER" doesn't. There is no advantage in having a "Gold" vs "SILVER" they are both
the same. I happen to have one of each and there is no difference in them. The boards are numbered the
same and the components are the same.

Subject: [TS-520_820_530_830] Standard and Gold TS-830S

Hi,

Was wondering what the differences are between the Standard and Gold models of the TS-830S? Also, how does one know which model one has? Is there any visual aspects on the radio that make it stand out, and easy to identify?

Regards

Kevin, ZL1KFM.

Hi Rick. I know some TS-530S rigs had a similar problem. Was caused by
high voltage surges from the antenna, and Kenwood issued a bulletin with
a fix. Not sure itf this is applicable to your TS-830.

You might go to http://www.k4eaa. com/index. html, and email Ken. Since
he services and restores Kenwood hybrid radios, he may be able to give
you an idea of where to look.

Good Luck!

Topic: 11493 Message: 11499

Oh one more thing I forgot to mention the chassis of the silver model has a gold irridite finish and the gold mdel
has a grey (phosphate) coating on the bare chassis to reduce rust. Personally I feel the gold finsh is better because
it seems to stay like new. My gold model has the grey coating and slight bits of discoloration on the chassis.
The silver model looks like it's never been touched and it was an EBay purchase. The WARC bands were never
opened up. "DON'T BELIEVE THE HYPE" it's not true ....

FCC Dumps Morse Code Requirement & Turns Down ARRL
Date: Fri, 15 Dec 2006 20:10:47 -0600
Subject: [SMC] FCC Dumps Morse Code Requirement & Turns Down ARRL Petition For Reconsideration

FOR IMMEDIATE RELEASE: NEWS MEDIA CONTACT:
December 15, 2006 Chelsea Fallon: (202) 418-7991

FCC MODIFIES AMATEUR RADIO SERVICE RULES,
ELIMINATING MORSE CODE EXAM REQUIREMENTS AND
ADDRESSING ARRL PETITION FOR RECONSIDERATION

Washington, D.C. - Today, the Federal Communications Commission (FCC) adopted a Report and Order and Order on Reconsideration (Order) that modifies the rules for the Amateur Radio Service by revising the examination requirements for obtaining a General Class or Amateur Extra Class amateur radio operator license and revising the operating privileges for Technician Class licensees. In addition, the Order resolves a petition filed by the American Radio Relay League, Inc. (ARRL) for partial reconsideration of an FCC Order on amateur service rules released on October 10, 2006.

The current amateur service operator license structure contains three classes of amateur radio operator licenses: Technician Class, General Class, and Amateur Extra Class. General Class and Amateur Extra Class licensees are permitted to operate in Amateur bands below 30 MHz, while the introductory Technician Class licensees are only permitted to operate in bands above 30 MHz. Prior to today's action, the FCC, in accordance with international radio regulations, required applicants for General Class and Amateur Extra Class operator licenses to pass a five words-per-minute Morse code examination. Today's Order eliminates that requirement for General and Amateur Extra licensees. This change reflects revisions to international radio regulations made at the International Telecommunication Union's 2003 World Radio Conference (WRC-03), which authorized each country to determine whether to require that individuals demonstrate Morse code proficiency in order to qualify for an amateur radio license with transmitting privileges on frequencies below 30 MHz. This change eliminates an unnecessary regulatory burden that may discourage current amateur radio operators from advancing their skills and participating more fully in the benefits of amateur radio.

Today's Order also revises the operating privileges for Technician Class licensees by eliminating a disparity in the operating privileges for the Technician Class and Technician Plus Class licensees. Technician Class licensees are authorized operating privileges on all amateur frequencies above 30 MHz. The Technician Plus Class license, which is an operator license class that existed prior the FCC's simplification of the amateur

license structure in 1999 and was grandfathered after that time, authorized operating privileges on all amateur frequencies above 30 MHz, as well as frequency segments in four HF bands (below 30 MHz) after the successful completion of a Morse code examination. With today's elimination of the Morse code exam requirements, the FCC concluded that the disparity between the operating privileges of Technician Class licensees and Technician Plus Class licensees should not be retained. Therefore, the FCC, in today's action, afforded Technician and Technician Plus licensees identical operating privileges.

Finally, today's Order resolved a petition filed by the ARRL for partial reconsideration of an FCC Order released on October 10, 2006 (FCC 06-149). In this Order, the FCC authorized amateur stations to transmit voice communications on additional frequencies in certain amateur service bands, including the 75 meter (m) band, which is authorized only for certain wideband voice and image communications. The ARRL argued that the 75 m band should not have been expanded below 3635 kHz, in order to protect automatically controlled digital stations operating in the 3620-3635 kHz portion of the 80 m band. The FCC concluded that these stations can be protected by providing alternate spectrum in the 3585-3600 kHz frequency segment.

Action by the Commission on December 15, 2006, by Report and Order and Order on Reconsideration. Chairman Martin and Commissioners Copps, Adelstein, Tate, and McDowell.

For additional information, contact William Cross at (202) 418-0691 or William.Cross@ fcc.gov.

WT Docket Nos. 04-140 and 05-235.

My feelings exactly Ruben, it's great the way help is so freely offered in the group. I read each and every post as well and try to help where I can. So at this time, I want to wish everyone on the board a very happy and safe seasons greetings to you and those in your family. It is my pleasure to be part of such a wonderful group.

This is sad that someone is trying to make money off the mods. He must not be a Ham that cares about the sport of being a ham and helping other people at the same time.
Chris W7CTH

Kevin & Natalia <sparcnz@...> wrote: Hi,

I have just been to the web site listed below. Interesting the Mods he has posted.
Interesting the price he charges for the mod to be carried out :(
Understand that he is in the business of servicing and electronics, however his prices put the cost way beyond the price that the radios are worth.
In my case I paid NZ$400 (US$260 approx), and at around US$430 (NZ$640), pointless, and that doesn't take into account the cost of shipping it to him, and back, another few hundred dollars.
And it does not appear he supplies the information on his pages for us to do ourselves, very sad. One would hope that in the spirit of Ham Radio this information would be freely available.

Anyway, if I could get the information, it would be nice to try. Not interested increasing the output power, if I want to do that I'll get a amp.

Anyway, that's my thoughts on the matter.

Kevin, ZL1KFM.

> The shield itself should connect to pin 7 at each end. I would
recommend miniature coax such as UG-174. A source of miniature coax
is a olde cell phone remote antenna. The other wires can be something
you can find and do not need to be shielded.
>
> A microphone cable will probably also work if it has a good shield.
the impedance is not critical. A straight multiple conductor mike
cable with a good shield around an individual wire would work neat.

Chris,

I have to disagree. Your time is always worth something. A small
repair or mod I wouldn't bother charging, but for extensive work or
mods, which I believe those on that site would be, I would charge for.
Maybe not as much as he is asking, but something. When you don't
charge, people tend to take advantage of you. I had so many calls from
friends with computer problems I told them I was going to start
charging an hourly rate. The calls stopped. Enough said.

Charging to do the mod for someone or working on someones radio is one thing.
You need to be payed for your time. But to sell a mod that you came up with to each person for then to do it for themselves for $100.00 or more is a bit heavy.

I know I am off track with this and I will not say anymore.

Bill,
Its 13 inches wide, 6 inches high, 13 inches long on the case, front to back, but when the fan and knobs are included, its 15 1/2 inches long. As I've been working on mine all day today, lifting it up and down, rolling it over, etc. I would estimate the weight at 30 to 35 pounds.

Now, does anyone know how to line up the pointer on the plate control and tighten the chain on the drive control?

It all depends on the individual situation. For some years I ran a computer group specialising in a particular range of computers. The original company had been taken over and the new company had no details of the old machines. I circulated a newsletter and software on a disc, nominally 6 a year. It was in the mid 1980's. The subscription was 6 GBP for 6 issues, with a returnable disc. No disc returned, no newsletter and etc. Advice was freely given, you had to have at least one disc drive. But, and this was a big but, everything was done to suit my time. I had a well paid full time job and this was my hobby. Sometimes I would be asked to rescue a disc, again that was done at my time schedule. There was always enough money in the bank. Donations would be made, none were asked for, but were gratefully received.

In the end the new owners were referring all enquiries to me!!!! Hi, Hi.

But, had I not had that full time job, it would have been different, money would have changed hands, and my relationship with the 'client' would have been different. I would have been under pressure, and probably not enjoyed all the work. As it was I learnt a lot that I have found useful to this day.

If this gentleman is running a business then he will soon learn if a. he's charging too much, b. he doesn't do a good job. With the 'net news travels fast, both good and bad.

As far as the 'pests' are concerned, if I think anyone is exploiting me, I just say "No", or even better, take a long time to respond. To be fair it has taken me some years to learn that, one benefit of age.

TS-820 much the same as TS-520

Dimensions 13.2" wide * 5.9" High * 13.2" Deep.

Weight 37.4 lbs

I suspect that is without the 13.8V Power Supply.

Kevin, at the bottom of your dial is a label that will tell you what you have. That is unless it has been changed which is unlikely.

The gold has an extra set of CW filters. That's basically the difference you'll note. There are other little things maybe, but that's the basics of it.

Hi Rick. I know some TS-530S rigs had a similar problem. Was caused by
high voltage surges from the antenna, and Kenwood issued a bulletin with
a fix. Not sure itf this is applicable to your TS-830.

You might go to http://www.k4eaa.com/index.html, and email Ken. Since
he services and restores Kenwood hybrid radios, he may be able to give
you an idea of where to look.

Good Luck!

11515. Kenwood TS-830 mods.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-17 00:00:05 UTC
From: court
Topic: 11515 Message: 11515

Hello all , i still cannot believe what a stir this has caused, after I asked if there were any audio mods that we can do for the TS-830. i think after asking weather someone could help , I think we have drifded of the main subject.
N9WB wrote to me sayng he was making an eq possibly for the TS-830s, This would be fantastic and i will be His FIRST customer !! Getting back to transmit mods, im open to someone even doing the work for me as I do not want to take the chance to mess up a perfect radio that was extremely hard to find.

This is the site in question
http://home.comcast.net/~esprepair/ts830mods.htm

Now if you go into the site , right into it, he offeres a TX and RX mod for FREE for the TS-520s , how nice of him .
site is as follows: http://home.comcast.net/~esprepair/ts520mods.htm

I can see now the 520s boys will be heading there directly, but can some other tech look at this mod , and offer me some assistance weather it would apply to the 830s?

Again , Im looking for someone to do a mod for ME as im not 100% confident in doing it myself, The problem bieng im In AUSTRALIA and this is where the problem starts and stops . A adjustable eq that would pass the Front Mic socket would be perfect but as we all know its the hard part.

Merry Xmas to all from down under
Dr Courtney McCarthy

11517. Going to start looking for an open freq. on 75m for a net

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-17 03:09:48 UTC
From: Ellen R
Topic: 11517 Message: 11517

Hi everybody,

Well Dec. 15 has come and gone, and I've decided to start doing some listening/tuning 75m to find an open freq. for a net. I will keep my listening above 3800 kHz, to so all General Class and higher group memebers can participate. I would like some input from the group members, as to what times and days would work out best for the net. I'll start tonight, but don't hold your breath. The last I checked, the A-index was still well over 50, from Thursday's Aurora (I saw it while driving home from work - it was beautiful). BTW, did any of you work any AU on Thursday? I did, I had a blast on 2m CW, working as far east as North Carolina.

73,
Ellen - AF9J

11518. Re: [TS-520_820_530_830] Kenwood TS-830 mods.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-17 04:29:08 UTC
From: John Harp
Topic: 11515 Message: 11518

Actually Courtney the topic of mods has been around before for the TS-830. As I recall it's been around more than once. Recently some mods were done bny a number of individuals done similtaneously.

So of course you will get alot of return mail in this group of the subject. Run back thru the old messages and you'll see. There are always things going on with this group.

To follow them is interesting. IN all my 30 years I've never seen so much and learned as I have here. It's an ever growing group.

Everybody is into something and maybe more than one thing and odds are they are sharing with someone else.

You can fix your radio to what you want and here is probably where you can find out how.

Even the accessories to some extent are touched upon. Mics have a reflector of thier own and QSO's another. You can buy trade and sell here within limitations.

As you can see if you have a question, if it's been covered you'll get plenty of responses sometimes varying in range of opinions but you get something for a response. Other times someone may ask a question that is of lesser known origin and may get few answers ir maybe not a response. But odds are it's something not touched upon yet, maybe an odd topic. Usually there's a little bit of interest from others observing and may be deciding if they would like to try it or pass.

Here you get evrything from the newcomer to the repair shop. From someone with just a basic Kenwood TS to a complete station of accessories. From CW to sideband and others into digital for looking to improve the audio of the radio. Even transverters and other accessories like a clock or the remote VFO or station monitor with oan display or the tuner and amplifier, crossing the Kenwood to something else. Making cables to match radios to accessories. Making the the TS work at QRP levels.

The list could go on and there's usually a good topic going around for someone interested in the vintage radios. They have potential. They've been around for years and if taken care of they will be around for more years. You can work on them.

If you have a question ask it. If you find no answer then help find one. If you get new info then offer it to the group. We archive here.If there's documentation we got it. If not and we find it we will make sure everyone can get at it.

If you're looking for something put the word out. Others will see something and pass the word back even if they don't know where it came from.

Now we may not know more of whats here in the states than elsewhere, granted. But the members and where each lives has alot to do with that.

But welcome to the group Courtney. use your TS-830 for a while and enjoy it. Think of what you like to do with it and toos the ideas with us. You may see someone else likes the idea

too. Hard to find part? ask around. Need advice to do something? somebody may talk you thru it. Need to ship it to someone for work more than you can do check here.

11520. Re: [TS-520_820_530_830] TS-830s Screen Grid Switch Issue

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-17 04:37:57 UTC
From: John Harp
Topic: 11478 Message: 11520

Actually I've noticed that during tube neutralizations. I flip the grid switch and all is well. Radio works fine. But when it's switched the other way the display goes out the meter is lit and the adio is quiet. I thought I'd broke it again, but after looking it over, I found the switch wasn't moved back to normal operation.

Makes me wonder about using it with a transverter or QRP. But I can use the 9volt battery and a pot for that low power work, just by changing the ALC.

If it works good, stick to it. By the way, when it happened to me I found nothing written anywhere about it. I've since heard others have it happen to them too.

w0ng@... wrote:
I'd greatly appreciate it if someone reading this posting might have an idea they would pass on to me as to why an otherwise good working Kenwood TS-830S transceiver literally goes "dark" when the screen grid switch is turned to the OFF position.

I was replacing a mismatched pair of finals (one 6146A and one 6146W) with a good pair of 6146B's. Started to begin the neutralization procedure by loading the xcvr up on 28.500 like normal but when I turned OFF the screen grid switch on the back panel the frequency display went dark and the SEND switch became inoperative (no relay action) along with all meter functions and controls.

Turned the screen grid switch back ON and everything returned to normal. Turned it OFF and again the display went dark, SEND switch was again inoperative along with everything else but the fan and indicator lamps. There was no measurable rf output from the driver stage on my scope when the screen grid switch was in the off position.

Really appreciate some help here as to why this is happening and how to fix it. If I haven't given enough background info, etc. let me know. Thanks in advance.

11521. RE: [TS-520_820_530_830] Standard and Gold TS-830S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-17 05:11:00 UTC
From: Rick KC0HH
Topic: 11493 Message: 11521

The ONLY difference was the color of the label. This was done by Kenwood as the 830S exceeded their expectations for sales. The 830s was always sold ' ala carte' with CW filters as optional. There is no such thing as a 'Gold Model' with stock CW filters and better circuit design.. File this under 'Urban Legend'

Rick KC0HH

John Harp <ka3dpw@...> wrote: Kevin, at the bottom of your dial is a label that will tell you what you have. That is unless it has been changed which is unlikely.

The gold has an extra set of CW filters. That's basically the difference you'll note. There are other little things maybe, but that's the basics of it.

phil pavey <PPAVEY@...> wrote:

Subject: [TS-520_820_530_830] Standard and Gold TS-830S

Hi,

Was wondering what the differences are between the Standard and Gold models
of the TS-830S?
Also, how does one know which model one has? Is there any visual aspects on
the radio that make it stand out, and easy to identify?

Regards

Kevin, ZL1KFM.

Subject: Re: [TS-520_820_530_830] Pesky S-Meter (TS830)

Hi Rick. I know some TS-530S rigs had a similar problem. Was caused by high voltage surges from the antenna, and Kenwood issued a bulletin with a fix. Not sure itf this is applicable to your TS-830.

You might go to http://www.k4eaa.com/index.html, and email Ken. Since he services and restores Kenwood hybrid radios, he may be able to give you an idea of where to look.

Good Luck!

From: n9wb
Topic: 11481 Message: 11522

Max, I agree,

As most of you know, I have some mods for D-104s. I publish all of these mods and do not use secret components with the numbers rubbed off. What many of you don't know is that I will also do the work for interested parties. But when I do the work I charge them a fair price.

I used to be in the radio repair business. Hopefully over the next year I plan to have my olde shop set up on my home property and among other things repair Kenwood Hybrids. But for those who want to learn and fix them themselves, I will still help them as I do now.

An excellent example is Bill K0ZL. He and his wife have one of the most competent Kenwood repair businesses anywhere. Yet, he founded this group, the Amateur-repairs group and others. He seldom mentions that he repairs radios, yet he is always busy. And he would always go out of his way to give advice and help you fix your own and learn. He likes to teach and help his fellow hams.

I have always been suspicious of "secret mods". But if a Amateur does work on your radio for you, he is entitled to compensation. If this were not the case, there would not be any honest place to get our rigs fixed.

I plan to review the mods mentioned as soon as I get caught up and give my opinion on them, For whatever it is worth.

Chris,

I have to disagree. Your time is always worth something. A small
repair or mod I wouldn't bother charging, but for extensive work or
mods, which I believe those on that site would be, I would charge for.
Maybe not as much as he is asking, but something. When you don't
charge, people tend to take advantage of you. I had so many calls from

friends with computer problems I told them I was going to start
charging an hourly rate. The calls stopped. Enough said.

Hello all , i still cannot believe what a stir this has caused, after I asked if there were any audio mods that we can do for the TS-830. i think after asking weather someone could help , I think we have drifded of the main subject.
N9WB wrote to me sayng he was making an eq possibly for the TS-830s, This would be fantastic and i will be His FIRST customer !! Getting back to transmit mods, im open to someone even doing the work for me as I do not want to take the chance to mess up a perfect radio that was extremely hard to find.

This is the site in question
http://home.comcast.net/~esprepair/ts830mods.htm

Now if you go into the site , right into it, he offeres a TX and RX mod for FREE for the TS-520s , how nice of him .
site is as follows: http://home.comcast.net/~esprepair/ts520mods.htm

I can see now the 520s boys will be heading there directly, but can some other tech look at this mod , and offer me some assistance weather it would apply to the 830s?

Again , Im looking for someone to do a mod for ME as im not 100% confident in doing it myself, The problem bieng im In AUSTRALIA and this is where the problem starts and stops . A adjustable eq that would pass the Front Mic socket would be perfect but as we all know its the hard part.

Merry Xmas to all from down under

It seems to me we had a discussion not too long ago about going into the balanced modulator though an equalizer like the IHY box to "improve" transmit audio. Shouldn't be that difficult to tap a point on the input to the balanced modulator to make that happen. Get your "full-body" SSB audio. Of course going in that way would render the front panel mike gain control and the speech clipper non functional.

TS-830:

This is my opinion on these ESP mods, for what it is worth. This is just my opinion. Walt N9WB

The receive and transmit audio mod. These mods claim to make the receiver hear from 40 Hz to 3000 Hz and transmit audio from 50 to 3100 Hz.

The TS-830 is a filter rig. I am not bothering to look up the exact width of the filters, but it can't be more than 2800 Hz with the 2 filters and that is between 6 dB points. So it is going to take some magic getting 40 to 3000 or 50 to 3100 past the filter and even then the attenuation at the edges will be quite great.

If we replace the filters with wider filters, we still have a problem. A filter rig suppresses the carrier with a balanced modulator. But this will only suppress the carrier so much. These rigs depend on the filter skirt to further suppress the carrier. This works because the carrier is outside of the filter bandpass. If you shift the carrier point closer to the filter bandpass to increase low frequency response, the carrier suppression will be compromised.

The description of these mods says "hear from XX to XXXX " and "transmit from XX to XXXX". When we specify the frequency response of an audio device, we usually specify if it is between 1, 3, or 6 dB points. So this claimed bandwidth could be between what? Between 21 dB points? I don't know.

In the file section of this group, under mods is an article "Audio Improvement in the Kenwood Hybrids". It shows how to change a capacitor to make the rig more open sounding. It gets rid of undesirable high frequency roll off on transmit. I will try to add some more mods for the receive and transmit audio for the TS-830 in a few days.

Increased Power output mod. Increases output from 125 watts to 200 watts! Wow! That is an increase of .7 dB (point 7 dB) . This is .117 (point 117) or 7/60 of an S unit. to do this, we are going to increase the input to the finals by 150 watts, and stress the diodes and the power transformer primary and HV winding by an extra 150 watts or to 180 % of its rated capacity. This mod has been around before. It involves increasing the screen voltage to the finals and a few other things.

I won't hot rod my vintage rig to 180% of it's rated capacity to gain 7/60 of an S unit. If I want more power, I will put the money toward an amplifier.

Tunable peak filter mod. This makes the notch a peak. I don't know anything about this, but if done properly it might be useful in some cases. However,

is it worth extensively modifying a vintage radio ?. You can do the same thing with a audio filter and still have the RF notch at the same time. Won't the VBT do this ? I am not very excited about this.

Is unlocking the IF shift and the VBT on a filter rig a very good idea? Unlocking the IF shift allows the carrier point to be shifted. This can really mess with carrier suppression.

Unlocking the VBT will allow you to make the transmit more narrow. But you do not have the option of having it one way for transmit and the other way on receive so I think that would have issues when working DX. You can narrow down the transmit audio with an equalizer. For DX use an equalizer and boost the audio above 1000 Hz. This would be more effective.

Now I better warn you, I am prejudiced against most mods. I have spent a lot of time de engineering "magic mods" to get a radio working properly again. I know nothing about the person offering these mods. But I would not do any of this to my TS-830. If you are interested into total ESSB with booming low bass, you need a digital rig with a menu such as a TS-850 or TS-870. These rigs will achieve lower low end than any filter rig can. I would be much more likely to put $450.00 toward one of these rigs than these mods.

Unless you are really into ESSB, Do you need or want all of this. Or are you just wanting good audio ? Like I said before, I will list a few capacitor changes that will improve the transmit and receive audio on the TS-830 as much as can be done within reason without extensive butchering of a vintage radio.

It is also possible to feed a audio rack directly into the balanced modulator. But I believe even that is far beyond what most of you probably need.

The above is my opinion, and is not meant to offend anybody. What you choose is your choice. It's just not for me.

Vy 73, Walt N9WB

BTW, if I was sent a rig that had these mods, and the owner wanted it restored to original, it would cost between $250.00 and $350.00. Remember, these mods are not published so we would have to reverse engineer them.

Subject: [TS-520_820_530_830] Kenwood TS-830 Mods

Good day group,
Was looking on google yesterday, and came across something that looks quite interesting. Im wondering if anyone within this group have managed to have a mod done to their radio as it looks very interesting without having expensive EQ's that really dont work to its fullest with this kind of radio that we all know has more

potential than we think and know these TS-830s can actually do. I will list these mods and would be intrested if anyone has attempted these at all. the List as follows.

1-EXPANDED TRANSMIT AUDIO MOD

Like the expanded receive mod, the transmit mod is usually done at the same time.

This enables the radio to transmit all of the audio that it should. The TS-830 is one of the last great sounding tube radios. Tubes will always sound better than solid state. Now let that TS-830 roar!

With this mod, the radio will transmit audio from 50hz to 3100Hz

2-UNLOCKED IF SHIFT/VBT MOD

The last and probably the most useful mod.

This mod unlocks the IF SHIFT and the VBT for transmit. It makes you sound like the station that you've tuned in. This is really advantageous when talking to a mobile. Mobile stations usually don't have many lows in their audio and your expanded transmit audio is just wasted energy to a mobile radio. This mod allows you to sacrifice your extended lows for extended highs where they will do some good for the mobile radio to hear.

Heil microphones and equalizers have been used for years in DX pileups because they cut through the background noise pileups. Now with this mod, you can instantly tailor your audio to suit your conditions. Better than a simple EQ, because with one knob, you can perfectly copy the other station, and at the same time make your signal a perfect copy for him to hear!

This should be designed into ALL radios with VBT/IF SHIFT !!

You would not believe what this mod does with the processor! Loud is an understatement.
You get volume and clarity without the grunge normally associated with processors.
No adjacent channel interference or clipping distortion either, just loud clean audio.

If anyone has any thoughts on this or have had done or attemped this , could you please drop me a line and i will supply the web site where this could be done. Im sure there are some quite smart people out there that could actually have done this before so please some feedback would be great
Cheers

Kevin, at the bottom of your dial is a label that will tell you what you have. That is unless it has been changed which is unlikely.

The gold has an extra set of CW filters. That's basically the difference you'll note. There are other little things maybe, but that's the basics of it.

Hi,

Was wondering what the differences are between the Standard and Gold models
of the TS-830S?
Also, how does one know which model one has? Is there any visual aspects on
the radio that make it stand out, and easy to identify?

Regards

Kevin, ZL1KFM.

Subject: Re: [TS-520_820_530_830] Pesky S-Meter (TS830)

Hi Rick. I know some TS-530S rigs had a similar problem. Was caused by high voltage surges from the antenna, and Kenwood issued a bulletin with a fix. Not sure itf this is applicable to your TS-830.

You might go to http://www.k4eaa.com/index.html, and email Ken. Since he services and restores Kenwood hybrid radios, he may be able to give you an idea of where to look.

Good Luck!

Topic: 11478 Message: 11528

Hey John,

Thanks for the reply to my posting. I've traced the wiring to and from the SG switch and it is correct. No mods at all. Maybe what I'm seeing when the rig goes dark is normal when the SG switch is in the off position.

73
Bill
w0ng

---- John Harp <ka3dpw@...> wrote:

==========
Actually I've noticed that during tube neutralizations. I flip the grid switch and all is well. Radio works fine. But when it's switched the other way the display goes out the meter is lit and the adio is quiet. I thought I'd broke it again, but after looking it over, I found the switch wasn't moved back to normal operation.

Makes me wonder about using it with a transverter or QRP. But I can use the 9volt battery and a pot for that low power work, just by changing the ALC.

If it works good, stick to it. By the way, when it happened to me I found nothing written anywhere about it. I've since heard others have it happen to them too.

w0ng@... wrote:
I'd greatly appreciate it if someone reading this posting might have an idea
they would pass on to me as to why an otherwise good working Kenwood TS-830S
transceiver literally goes "dark" when the screen grid switch is turned to the
OFF position.

I was replacing a mismatched pair of finals (one 6146A and one 6146W) with a
good pair of 6146B's. Started to begin the neutralization procedure by loading
the xcvr up on 28.500 like normal but when I turned OFF the screen grid switch
on the back panel the frequency display went dark and the SEND switch became
inoperative (no relay action) along with all meter functions and controls.

Turned the screen grid switch back ON and everything returned to normal. Turned
it OFF and again the display went dark, SEND switch was again inoperative along
with everything else but the fan and indicator lamps. There was no measurable rf
output from the driver stage on my scope when the screen grid switch was in the
off position.

Really appreciate some help here as to why this is happening and how to fix it.
If I haven't given enough background info, etc. let me know. Thanks in advance.

Well my 830 went south for some reason, I can't get the bias down at all. No where near the 60ma where it should be, more like 300 plus. Anyone have a idea whats going on here?? Thanks Danny

I've traced the wiring to and from the SG switch and it is correct. No mods at all. Maybe what I'm seeing when the rig goes dark is normal (?) when the SG switch is in the OFF position. Trouble is that the SEND switch relay in inoperative at that point too. Can't seem to get any rf output at all from the driver stage to do the tube neutralization. Hmmmmmmmm?

From: Chris HEmbree
Topic: 11481 Message: 11531

I replaced c106 in the IF board to a 100uf cap. I use a Heil Gm5 mic. I don't care about ESP on the TS830s. I have been told by all the people that I have talked with that my audio is very good.

We have some very sharp people in this group like Walt and others that will bless some of the mods and help you do them.
You can go to far on mods and you end up with a very nice CB radio that puts out a 100watts.
Hi! HI! Marry Christmas to all!!
Chris W7CTH

n9wb <n9wb@...> wrote: TS-830:

This is my opinion on these ESP mods, for what it is worth. This is just my opinion. Walt N9WB

The receive and transmit audio mod. These mods claim to make the receiver hear from 40 Hz to 3000 Hz and transmit audio from 50 to 3100 Hz.

The TS-830 is a filter rig. I am not bothering to look up the exact width of the filters, but it can't be more than 2800 Hz with the 2 filters and that is between 6 dB points. So it is going to take some magic getting 40 to 3000 or 50 to 3100 past the filter and even then the attenuation at the edges will be quite great.

If we replace the filters with wider filters, we still have a problem. A filter rig suppresses the carrier with a balanced modulator. But this will only suppress the carrier so much. These rigs depend on the filter skirt to further suppress the carrier. This works because the carrier is outside of the filter bandpass. If you shift the carrier point closer to the filter bandpass to increase low frequency response, the carrier suppression will be compromised.

The description of these mods says "hear from XX to XXXX " and "transmit from XX to XXXX". When we specify the frequency response of an audio device, we usually specify if it is between 1, 3, or 6 dB points. So this claimed bandwidth could be between what? Between 21 dB points? I don't know.

In the file section of this group, under mods is an article "Audio Improvement in the Kenwood Hybrids". It shows how to change a capacitor to make the rig more open sounding. It gets rid of undesirable high frequency roll off on transmit. I will try to add some more mods for the receive and transmit audio for the TS-830 in a few days.

Increased Power output mod. Increases output from 125 watts to 200 watts! Wow! That is an increase of .7 dB (point 7 dB) . This is .117 (point 117) or 7/60 of an S unit. to do this, we are going to increase the input to the

finals by 150 watts, and stress the diodes and the power transformer primary and HV winding by an extra 150 watts or to 180 % of its rated capacity. This mod has been around before. It involves increasing the screen voltage to the finals and a few other things.

I won't hot rod my vintage rig to 180% of it's rated capacity to gain 7/60 of an S unit. If I want more power, I will put the money toward an amplifier.

Tunable peak filter mod. This makes the notch a peak. I don't know anything about this, but if done properly it might be useful in some cases. However, is it worth extensively modifying a vintage radio ?. You can do the same thing with a audio filter and still have the RF notch at the same time. Won't the VBT do this ? I am not very excited about this.

Is unlocking the IF shift and the VBT on a filter rig a very good idea? Unlocking the IF shift allows the carrier point to be shifted. This can really mess with carrier suppression.

Unlocking the VBT will allow you to make the transmit more narrow. But you do not have the option of having it one way for transmit and the other way on receive so I think that would have issues when working DX. You can narrow down the transmit audio with an equalizer. For DX use an equalizer and boost the audio above 1000 Hz. This would be more effective.

Now I better warn you, I am prejudiced against most mods. I have spent a lot of time de engineering "magic mods" to get a radio working properly again. I know nothing about the person offering these mods. But I would not do any of this to my TS-830. If you are interested into total ESSB with booming low bass, you need a digital rig with a menu such as a TS-850 or TS-870. These rigs will achieve lower low end than any filter rig can. I would be much more likely to put $450.00 toward one of these rigs than these mods.

Unless you are really into ESSB, Do you need or want all of this. Or are you just wanting good audio ? Like I said before, I will list a few capacitor changes that will improve the transmit and receive audio on the TS-830 as much as can be done within reason without extensive butchering of a vintage radio.

It is also possible to feed a audio rack directly into the balanced modulator. But I believe even that is far beyond what most of you probably need.

The above is my opinion, and is not meant to offend anybody. What you choose is your choice. It's just not for me.

Vy 73, Walt N9WB

BTW, if I was sent a rig that had these mods, and the owner wanted it restored to original, it would cost between $250.00 and $350.00. Remember, these mods are not published so we would have to reverse engineer them.

Subject: [TS-520_820_530_830] Kenwood TS-830 Mods

Good day group,
Was looking on google yesterday, and came across something that looks quite interesting. Im wondering if anyone within this group have managed to have a mod done to their radio as it looks very interesting without having expensive EQ's that really dont work to its fullest with this kind of radio that we all know has more potential than we think and know these TS-830s can actually do. I will list these mods and would be intrested if anyone has attempted these at all. the List as follows.

1-EXPANDED TRANSMIT AUDIO MOD

Like the expanded receive mod, the transmit mod is usually done at the same time.

This enables the radio to transmit all of the audio that it should. The TS-830 is one of the last great sounding tube radios. Tubes will always sound better than solid state. Now let that TS-830 roar!

With this mod, the radio will transmit audio from 50hz to 3100Hz

2-UNLOCKED IF SHIFT/VBT MOD

The last and probably the most useful mod.

This mod unlocks the IF SHIFT and the VBT for transmit. It makes you sound like the station that you've tuned in. This is really advantageous when talking to a mobile. Mobile stations usually don't have many lows in their audio and your expanded transmit audio is just wasted energy to a mobile radio. This mod allows you to sacrifice your extended lows for extended highs where they will do some good for the mobile radio to hear.

Heil microphones and equalizers have been used for years in DX pileups because they cut through the background noise pileups. Now with this mod, you can instantly tailor your audio to suit your conditions. Better than a simple EQ, because with one knob, you can perfectly copy the other station, and at the same time make your signal a perfect copy for him to hear!

This should be designed into ALL radios with VBT/IF SHIFT !!

You would not believe what this mod does with the processor! Loud is an understatement.
You get volume and clarity without the grunge normally associated with processors.
No adjacent channel interference or clipping distortion either, just loud clean audio.

If anyone has any thoughts on this or have had done or attemped
this , could you please drop me a line and i will supply the web
site where this could be done. Im sure there are some quite smart
people out there that could actually have done this before so
please some feedback would be great
Cheers
dr Courtney McCarthy

From: mi_magic3
Topic: 11532 Message: 11532

Hi all....Hope someone can give me some tips on what to look for with a tune up/output problem. I took aprt my 830 and cleaned the front panel, knobs, etc. I also sprayed contact cleaner on the band switch and all of the pots I could get to. This rig came from a heavy smoker and the volume knob was all "scratchy", so I thought some contact cleaner was in order. I removed the tubes and dusted those off, oiled the fan bearing and cleaned that area. Re-assembled and all good on recieve. I connected a 300W dry dummy load and attempted the tune up procedure. I place the rig in USB, and do get the 60 mA bias showing up. Placing the rig in TUNE mode and meter setting to ALC, I do get some metere deflection but only if I increase the carrier control. I don't seem to be getting and output power. I do hear a the rig on my 847 on the same frequency (no antenna connected on the 847), so I think that the driver section on the 830 is working. Did I break something going into the rig? On advice on others, I did flip the 830 over during the cleaning process and touch up the solder connections on the 6146 tube sockets, close inspection showed a fine crack around a few of the pins. I've worked on video monitors before and have seen the same type of solder connection problems on flyback transformers and it would make monitors go dead once they warmed up. I figured re-soldering them would be prudent. I did not have the tubes in the sockets at the time they were being re-soldered. I do not believe I have any solder bridges or shorts. I do see that the heaters are on for all 3 tubes. I sure hope I didn't toast this rig! I want to get it on the air. Any suggestions (yes you can flame me!!!) would be most appreciated.

From: ve3tmt
Topic: 11481 Message: 11533

Walt and the group,

Without beating a dead horse I will offer my opinions based on my experiences with the audio mods to the 830 and I will try to be brief and this will be my only post on this subject...

As far as TX audio mods go I have done the following..

1. Swapped out C106 to a .01uf
2. Replaced the modulator diodes with the low noise as discussed previously.
3. Replaced the stock SSB filter with a YK-88S2 (3 Khz BW)
4. Direct balanced modulator feed from rear of radio.

The first three will work regardless of where you feed your mic audio. The purpose of #4 is to bypass the internal mic amps which restrict the frequency response of your audio and allows the full bandwidth of your TX audio to get "into" the audio chain. If you are using a mic like the MC-50 or other mic made for amateur use, forget this mod. To take advantage of the modulator feed, you need external processing gear like mic preamps, EQ's and such which will feed a line level signal into the modulator. You will also need a good studio mic with a flat response curve. If you have not swapped the stock SSB filter for a wider once, then you are wasting your time. Also with the modulator feed, you bypass the VOX and processor circuits so these no longer work.

I have used studio rack gear as well as the W2IHY stuff with the 830 and I now use dynamic mic fitted with an electret element and in my opinion I have achieved the best results with this setup so far. When I was running the rack gear, I fiddled with VR2 on the PLL board, which adjusts your carrier insertion point. It did provide for some nice audio but it had lost the famous 830 sound. So aside from the diode swap and the cap change the radio is now back to normal. In my opinion you would need to swap the SSB filter to an INRAD # 475 (4 Khz BW) to really play with the audio. But there is also a 455 IF filter in there that needs to be swapped as well or it will negate the effects of the 4K filter.

As for the receive, I swapped the dectector diodes as well as a few caps on the AF board to increase the low end response. To tell you the truth I can't tell the difference before or after any of the receive mods. I also have a fixed level RX output on the rear to feed my soundcard for digital work. The audio is tapped on the AF board before the AF GAIN control.

So I guess in summary, if you want to invest the time and money anything is possible. But as Walt said, save your money and buy a used

850 or 940 and work on those. In my opinion the 830 is just fine the way it is.

I tried to be brief, honest...

Topic: 11478 Message: 11535

Yeah Bill like I said, when it happened to me I was getting upset. When I calmed down I went to have a look and found the switch in the wrong position. I flipped the switch and plugged it in and all was well.

I had just cleaned the rig. and check the neutralization. Talk about a relief.

But like I said. With the instructions I had on the transverter you should be able to flip the switch for low output for the transverter. I figure when I cable assembly the two I'll just use the old technique of a 9 volt battery and a potentiometer to cut the ALC.

That's in the archives for us if you ever need it, Thanks to James. and it will work to QRP levels ans well as reducing the drive for a Linear Amplifier. james has transverters also.

So things to know for the future should you ever need them.

I got Linear Amps on air and nearing my first VHF transverters too.

73's and enjoy.

From: John Harp
Topic: 11532 Message: 11536

Dave, I don't flame. That is counter productive. your in a learning session right now and you took some good steps here.

You touched up the solder that's good so long as you don't apply to much heat to the socket. Yes a good idea to pull the tubes to do the hot work.

My question is did you put the same tubes back in the same sockets. Now I admit this sounds dumb, but if those tubes weren't a match when instaled and neutralized initially and you swapped sides this could be something of that problem. I suggest the neutralization procedure be done. This info can be found in our archives if you need it.

Secondly, you could swap the driver tube 12BY7A for a known to be good tube. While in there look at the grid resistors on your PA, if you haven't already. It's good insurance and cheap measures of prevention.

Third, make sure you are tuning up as the manual tells you to. This prevents problems and you'll know something isn't right if your readings sound off. It sounded like you may have as you wrote the message, but I mention it just to make sure.

The volume knob as I remember has a little opening along it's face as I remember. Try to remove the knob from the mount and see if it has that opening. If it does then spray the good cleaner in there and run the wiper and shaft back and forth several times. Do it again. What this does is it cleans the pots wiper surfaces of any contaminants. This will often times eliminate any scrachy sound you hear in the audio of older equipment.

And like I said clena your grounds and make sure they are tight. This person was a smoker as you say and this radio has been around for 30 years. Contamininants get into everywhere with extended time.

These measures I've told you if applied may elimimate the problem for you. They are simple to do and they eliminate the possibilities when troubleshooting. They may avoid a future issue for you too.

These are the kind of things those of us who have vintage equipment do to keep our gear going. So make sure of them first.

I once had a feedback problem on the mic. I switched antenna and no difference. It howled right back to the speaker. I shielded the line and still the same even with chokes on both lines. I checked the microphone wires and connections for something broken and found nothing. It didn't occur when using the straight key.

So I went to cleaning mode thoroughly and even pulled the knobs and connectors and cleaned behind them. Ceaned the mic jack and put it back on and retightened. The problem dissapppeared. It hasn't come back.

That's why I say maintenance. Routine maintenance, it solves so much and keeps you informed about the way the radio is inside. An ounce of prevention is worth a pond of cure.

An increase in power from 125 to 200 watts would be 2.04 dB, or about 1/3 to 1/2 of an S unit depending on your S meter. Walt is right; this mod would not be worthwhile, even not considering the added stress to components.

My question is why put the meter in ALC position for tune up? I TUNE my 820 with the meter switch in IP, increase CAR, peak the plate current with the DRIVE and dip the plate with the PLATE then adjust LOAD for max output into a dummy load then switch to antenna for tuner adjustment. Works every time.

Am I missing something here? I don't see where the manual says to use the ALC meter position during tune up. I use the ALC meter position when setting the linear's ALC and transmit audio adjustment in sideband, for example.

Happy Holidays to everyone.

> The volume knob as I remember has a little opening along it's face as I remember. Try to remove the knob from the mount and see if

it has that opening. If it does then spray the good cleaner in there and run the wiper and shaft back and forth several times. Do it again. What this does is it cleans the pots wiper surfaces of any contaminants. This will often times eliminate any scrachy sound you hear in the audio of older equipment.

11540. Keyer on TS830-S & 430S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-17 22:56:21 UTC
From: Bernard Arcand
Topic: 11540 Message: 11540

Hi group...the depth of knowledge in this group is amazing and so I'm asking why...why is it that on my 830, my electronic keyer works great, but unplug it from the phone jack (key input) in the back of the 830, and plug it into the 430S key jack and it doesn't work...it doesn't key up the radio, whereas a straight key will. What's the difference between the two?? How can I change the Keyer to work with the 430S and still retain its ability on the 830S??

Thanks in advance...

Bernie in ND

Topic: 11532 Message: 11541

In the manuals for the 820s and 830s it specifically says that the ALC circuitry has, in essence, a strong feedback. What this does is the point where the current dips when tuning is not the same place where the maximum output is. In a tube-type transmitter where there is no ALC, the current dip point is the same as the maximum output point.
That's why the manual says to have it in the ALC position.

Older transmitters that did not have ALC you tuned for a current dip.

In W5RKL's he's tuning up a slightly different way, but in the case of 820s and 830s if you tune for maximum output, you will be tuning for maximum ALC. So W5RKL is tuning up in a correct manner that will not harm the finals.

w5rkl <w5rkl@...> wrote:

My question is why put the meter in ALC position for tune up? I TUNE
my 820 with the meter switch in IP, increase CAR, peak the plate
current with the DRIVE and dip the plate with the PLATE then adjust
LOAD for max output into a dummy load then switch to antenna for
tuner adjustment. Works every time.

Am I missing something here? I don't see where the manual says to use
the ALC meter position during tune up. I use the ALC meter position
when setting the linear's ALC and transmit audio adjustment in
sideband, for example.

Happy Holidays to everyone.

Well... two steps forward with my TS-820S. With the fix to R13 on the rf board and correct final cathode resistors in place I now easily get 60 ma idle current.

And one backward. Now I have no rf output, no drive when metering ALC in Tune mode and SEND. Here's what I'm seeing:

- All filaments lit, SG Switch ON, XVERTER Switch OFF, CAR control full. Q5, D7, R13, R14 on rf board checked good. Known good finals.

- HV(Tune Mode, SEND) 850v
- HV(CW Mode, SEND) 810v
- HV(USB Mode, SEND) 825v

- SG(CW/USB Mode, REC) 228v
- SG(CW Mode, SEND) 208v
- SG(USB Mode, SEND) 211v
- SG(Tune Mode, REC) 112v
- SG(Tune Mode, SEND) 105v

- FG(REC) -92v
- FG(Tune/CW/USB, SEND) -45v

- 12by7 plate (REC) 326v
- 12by7 plate (Tune Mode, SEND) 306v
- 12by7 plate (CW/USB Mode, SEND) 297v
- 12by7 bias voltage (any Mode) 217v

Suggestions as where to experiment next gladly accepted.

Hi Dave. You need to follow the transmitter tune-up procedure from the manual. If you don't have the manual, they are available on the net.

It seems that you are doing only part of the tune-up procedure.
You will probably not get much meter deflection at the point you seem to be in the tune up procedure. Did you try to do the rest of the tune-up procedure? Do you have a way to test the tubes? One or more of them may be bad.

Whatever you do, don't give up! There are some very competent and helpful people here that can surely help you get the rig up and running.

Good Luck!

From: Gordon
Topic: 11540 Message: 11544

It's because the 830 is Grid Block keyed and the TS-430S is probably
Direct Keyed. On my keyer, I must switch a jumper to change from the
tube typr rig to the Solid state rig.

Bernie,

Your keyer is set up for keying a negative voltage. The '430 has a positive voltage on the key line. Since I have both types of rigs, I've built an optically-isolated interface between my key and rigs that has 2 negative and 2 positive keying outputs.

11546. Re: TS-520SE Lining up Knobs

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-18 00:00:21 UTC
From: baumbrent
Topic: 11480 Message: 11546

I'm bringing this post back to the front of the queue because I think it may have been overlooked. I really need to know the starting position for the pointer on the plate adjustment knob so I can tune the 520SE and get back on the air.

In spite of this small problem I fired it up yesterday for a smoke test. The replacement of the 10 meter crystals worked fine. Good oscillation with the calibrator turned on and tuning around the bands I picked up some DX. I picked up a strong 10 or 15 over 9 SSB from a CE3 (Chile)on 20 meters at about 3:30 pm MST. I didn't try to reply because I wasn't sure of my tuning.

Thanks for being a great forum.

OK, I found it in a search and will now stop whining. Just FYI for
those in the same boat(anchor); the plate pointer should be at the 9
o'clock position with the plates fully meshed. The directions are
way back in message #3200 from K0ZL.

11548. I think I broke it!!!!

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-17 23:47:49 UTC
From: Tibor (Tibi) Zentai
Topic: 11532 Message: 11548

I neither understand why ALC should be used for tuning.

Two methods are known and suggested.

First one:

Meter in IP, with DRIVE you can find a max. IP while taking care of not exceeding 50 mA.
With PLATE try to find a dip on IP. If you can't, go to the second one.
Switch to RF and set max. with LOAD.
Grow IP to 50 mA again if needed.

Repeat the whole process until there is no more change.

Then grow IP to 200 mA, switch to RF and set max. with LOAD. This process should not exceed 5 (five) seconds!

You are ready.

Second one:

Meter in IP, with DRIVE you can find a max. IP while taking care of not exceeding 50 mA.
Switch to RF and first with PLATE then LOAD set a max.
Grow IP to 50 mA again if needed.

Repeat the whole process until there is no more change.

Then grow IP to 200 mA, switch to RF and set max with LOAD. This process should not exceed 5 (five) seconds!

You are ready.

Your tubes will be grateful.

When you operate CW (with full power) the correct ALC setting is half of the ALC scale, in SSB full scale can be allowed but no more.

In digi modes the 40 W input power should not be exceeded.

Other:

A few months ago there was a topic about loosing 28 Megs. Since I suffered from the same problem, in the begging of ARRL 10m I solved the problem. Why so late? It was the contest I wished to take part and the radio said "no".

In my case the problem was one of the wafer (rotary) switch panels slightly deviating from the vertical position. It made a eccentricity that caused 10 m (28000-28500 kHz segment, earlier 40 m band alternatively) lost.

The problem was fixed after all and the radio works in order again.

The maintenance you, Dave, have described is done in every half year here.
My radio is a TS-530SP in a "heavy duty" operation e.g. in different
contests. I have logged more than 21.000 QSO's with it in 2 and a 3/4
years.

It still works like a brand new one.

Happy Holidays and HNY to everyone!

Tibi, HA2MN (HA502MN till the end of year)

11549. Power Output

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-17 23:59:40 UTC
From: Gene Hawkins
Topic: 11549 Message: 11549

Bob,

If power output meters were calibrated in db gain
instead of watts or power, I think there would be
a lot less worry about how many watts the rig is
doing and a lot less stress on components, and
a lot of mods would overall prove fruitless.

73,

Gene Hawkins
KA5CNT

I believe that the knob should be in about the 9 Oclock position with
the Plates fully closed.

From: Thomas Carney
Topic: 11532 Message: 11551

As I've explained before the ALC in 820s and 830s has a strong feedback. In order to keep reflected power down, top ALC is the right way. It's this particular design.

"Tibor (Tibi) Zentai" <ha2mn@...> wrote:
I neither understand why ALC should be used for tuning.

Two methods are known and suggested.

First one:

Meter in IP, with DRIVE you can find a max. IP while taking care of not exceeding 50 mA.
With PLATE try to find a dip on IP. If you can't, go to the second one.
Switch to RF and set max. with LOAD.
Grow IP to 50 mA again if needed.

Repeat the whole process until there is no more change.

Then grow IP to 200 mA, switch to RF and set max. with LOAD. This process should not exceed 5 (five) seconds!

You are ready.

Second one:

Meter in IP, with DRIVE you can find a max. IP while taking care of not exceeding 50 mA.
Switch to RF and first with PLATE then LOAD set a max.
Grow IP to 50 mA again if needed.

Repeat the whole process until there is no more change.

Then grow IP to 200 mA, switch to RF and set max with LOAD. This process should not exceed 5 (five) seconds!

You are ready.

Your tubes will be grateful.

When you operate CW (with full power) the correct ALC setting is half of the ALC scale, in SSB full scale can be allowed but no more.

In digi modes the 40 W input power should not be exceeded.

Other:

A few months ago there was a topic about loosing 28 Megs. Since I suffered from the same problem, in the begging of ARRL 10m I solved the problem. Why so late? It was the contest I wished to take part and the radio said "no".

In my case the problem was one of the wafer (rotary) switch panels slightly deviating from the vertical position. It made a eccentricity that caused 10 m (28000-28500 kHz segment, earlier 40 m band alternatively) lost.

The problem was fixed after all and the radio works in order again.

The maintenance you, Dave, have described is done in every half year here. My radio is a TS-530SP in a "heavy duty" operation e.g. in different contests. I have logged more than 21.000 QSO's with it in 2 and a 3/4 years.

It still works like a brand new one.

Happy Holidays and HNY to everyone!

Tibi, HA2MN (HA502MN till the end of year)

11553. TS-520 transmitter knocked out by HD-1410

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-18 02:14:17 UTC
From: magicalmichaelmerlin
Topic: 11553 Message: 11553

I'm new to the reflector and would appreciate some thoughts on my situation. I purchased a TS-520 at our club's auction last week. I was able to tune the finals without any problem, using a straight key. I made a single QSO, but with a 599 report.
I am aware of the -65V grid block keying set-up of the 520. I thought I would be alright plugging in a Heathkit HD-1410. Unfortunately, all I got was a single continuous tone on plugging it in, so I quickly disconnected it. Too late - no more current at the plate with the meter in the IP setting (LSB mode, for 40M), no readings in the tune position for drive or plate, and of course no powe rout for CW using the straight key. (None at my SWR meter either - I am using an R7000, but have the SWR in line anyway).
So, I fear I have at the very least blown the final tubes with an HD-1410. By the way, the receiver seems to work ok (hard to tell because of band conditiosn lately!) Questions for the group:
Am I wrong about the HD-1410? I thought it was built to accomodate grid block keying. (I wonder (too late) if perhaps the particular unit I have was modified to work with later rigs.)
Could I have lucked out and simply blown a fuse? I am not aware of any fuse in line near the key input.
I don't have a sufficient background to even think about doing my own repairs. There are some fellow hams here in Chicago, who could help me out, but I am seriously thinking of sending the rig to Ken K4EAA. Any comments on this route? Has anyone had him work on a rig (esp the 520) with this type of problem? (There are some very minor issues with the front panel - the dial scale is not properly meshing with the sub-dial, but I can easily live with that).

I should add I am almost entirely a CW op. I've only had my ticket since 1998, but am an extra (the 520 is my first tube rig!). However, I'm a doctor, not an engineer! I like to think I know my limits, so am quite ready to have this repaired by someone else. I must say I really, really like the TS-520 - it meets my needs for what I want, in terms of CW operating - if I can get a keyer into it (I can do straight key work alright, but I really want to use a keyer).
Thanks!

I do know that an HD-1410 will key a 520 - that's what I use. There are lots of folks here that will be able to help.

hi dave,

by design, output is reduced to protect the finals when mode is TUNE,
I bet if you change to CW and with dummy load attached
you will see output on the meter.

I remember 'drive-plate-load' (top row on rig)
to help me tune.

We don't flame people who need help with their rigs. And I have often worked on a rig and had new issues to sort out afterward, sometimes accompanied by a room full of smoke and the beeping of the smoke alarm. So please do not be discourage. I applaud your attempt at doing your own preventative maintenance. It is very unlikely that the rig is toasted, particularly if you did not smell smoke.

The problem is probably either that something has accidentally been set wrong or something has become dislodged.

Since you are able to get the 60 ma of idle current, your screen grid switch is on as it should be. The finals are also likely fine. If your carrier control fully up? Use the tune mode. Place the meter switch in ALC with the carrier control fully up. Be sure that you do not have a key plugged into the key jack. Key up the rig and attempt to peak the drive control while watching the meter in the ALC position. Do you get anything ?

If not let us know and we will go from there. If you do get an ALC reading, change the meter to the RF position and peak the plate and load control for maximum.
Be sure that the drive control is fully up.

If you have the optional VFO plugged in, unplug it.

If you are unable to do this, tell us and we will look deeper into the problem.

Subject: [TS-520_820_530_830] I think I broke it!!!!

Hi all....Hope someone can give me some tips on what to look for
with a tune up/output problem. I took aprt my 830 and cleaned the
front panel, knobs, etc. I also sprayed contact cleaner on the band
switch and all of the pots I could get to. This rig came from a
heavy smoker and the volume knob was all "scratchy", so I thought
some contact cleaner was in order. I removed the tubes and dusted
those off, oiled the fan bearing and cleaned that area. Re-
assembled and all good on recieve. I connected a 300W dry dummy
load and attempted the tune up procedure. I place the rig in USB,
and do get the 60 mA bias showing up. Placing the rig in TUNE mode
and meter setting to ALC, I do get some metere deflection but only
if I increase the carrier control. I don't seem to be getting and
output power. I do hear a the rig on my 847 on the same frequency
(no antenna connected on the 847), so I think that the driver
section on the 830 is working. Did I break something going into the
rig? On advice on others, I did flip the 830 over during the

cleaning process and touch up the solder connections on the 6146 tube sockets, close inspection showed a fine crack around a few of the pins. I've worked on video monitors before and have seen the same type of solder connection problems on flyback transformers and it would make monitors go dead once they warmed up. I figured re-soldering them would be prudent. I did not have the tubes in the sockets at the time they were being re-soldered. I do not believe I have any solder bridges or shorts. I do see that the heaters are on for all 3 tubes. I sure hope I didn't toast this rig! I want to get it on the air. Any suggestions (yes you can flame me!!!) would be most appreciated.

vy 73
Merry Christmas!

Subject: [TS-520_820_530_830] Re: TS-520SE Lining up Knobs

I'm bringing this post back to the front of the queue because I think it may have been overlooked. I really need to know the starting position for the pointer on the plate adjustment knob so I can tune the 520SE and get back on the air.

In spite of this small problem I fired it up yesterday for a smoke test. The replacement of the 10 meter crystals worked fine. Good oscillation with the calibrator turned on and tuning around the bands I picked up some DX. I picked up a strong 10 or 15 over 9 SSB from a CE3 (Chile)on 20 meters at about 3:30 pm MST. I didn't try to reply because I wasn't sure of my tuning.

Thanks for being a great forum.

From: n9wb
Topic: 11419 Message: 11558

Do you have a scope? If so, tell us as it will be very useful. Otherwise we will assume that you do not.

First, check to be sure that the 12BY7 is lit.
Next check that the RF board is seated properly and all of the connectors at the top of the board are properly seated.

There is a connection from a point on the coil pack board labeled DRV to a feed through on the final cage wall. Be sure that this has not broken off.

Be sure that the VFO switch is straight up in the VFO position.

If none of this pans out, Make the following checks.

You got the following:

Pin 7 of the 12BY7 - 12by7 plate (Tune Mode, SEND) 306v
This is OK

Pin 8 of the 12BY7 - 12by7 bias voltage (any Mode) 217v
This is the screen grid and is OK

Now check:

Pin 1 of the 12BY7. This is the cathode. Correct reading is 0 V.
Pin 2 of the 12BY7 This is the control grid, should read 4.3 volts or 10 V.
Check it with drive control up and down.

See if you can hear the carrier on a nearby receiver.

Let us know and we will go from here. Again, do you have a scope or an RF probe ?

Well... two steps forward with my TS-820S. With the fix to R13 on the rf board and correct final cathode resistors in place I now easily get

60 ma idle current.

And one backward. Now I have no rf output, no drive when metering ALC
in Tune mode and SEND. Here's what I'm seeing:

- All filaments lit, SG Switch ON, XVERTER Switch OFF, CAR control
full. Q5, D7, R13, R14 on rf board checked good. Known good finals.

- HV(Tune Mode, SEND) 850v
- HV(CW Mode, SEND) 810v
- HV(USB Mode, SEND) 825v

- SG(CW/USB Mode, REC) 228v
- SG(CW Mode, SEND) 208v
- SG(USB Mode, SEND) 211v
- SG(Tune Mode, REC) 112v
- SG(Tune Mode, SEND) 105v

- FG(REC) -92v
- FG(Tune/CW/USB, SEND) -45v

- 12by7 plate (REC) 326v
- 12by7 plate (Tune Mode, SEND) 306v
- 12by7 plate (CW/USB Mode, SEND) 297v
- 12by7 bias voltage (any Mode) 217v

Suggestions as where to experiment next gladly accepted.

So,

What do you guys have in your Auxiliary position on the bandswitch? (830s) Anyone have 60 meters? Anything else?

Curious.

Steve,

60m would be a great idea, except us Canadians don't have access to
that band yet. I bet a lot of 11m operators have that band in there!

About the only receive band that you CANNOT put in the AUX bandswitch would be any frequency range that contains 8.83 MHz because there's a notch filter on the front end that prevents external 8.83 MHz signals from getting into the first IF.

How is the AUX band set up anyway? Is a crystal required? I think some
of the coils on the RF board are missing for the AUX position. Perhaps
I am wrong.

A crystal is required to set up the PLL in the proper frequency range. Coils with ferrite in them must be installed also. There may have to be some capacitors installed. I'm not sure one can transmit with the coils installed because the proper taps have to be installed on the pi-L output tank to resonate the transmit side with the PA. I haven't looked at it for a number of years but the AUX band MIGHT be a receive-only modification.

From: John Harp
Topic: 11553 Message: 11567

Well there's more people here in the group that can help you that way. Ken is one person who could do the job. There are others like Cliff Holland have a shop too.

But before you go that path, see what comes back from the group. Now's the time when you get to see this resource at work. Give Walt or one of the moderators a chance to comment. This is where you have a learning opportunity. Others here have 520 also or have had them like James. You may still be able to do this yet. Let's see.

magicalmichaelmerlin <magicalmichaelmerlin@...> wrote:
I'm new to the reflector and would appreciate some thoughts on my situation. I purchased a TS-520 at our club's auction last week. I was able to tune the finals without any problem, using a straight key. I made a single QSO, but with a 599 report.
I am aware of the -65V grid block keying set-up of the 520. I thought I would be alright plugging in a Heathkit HD-1410. Unfortunately, all I got was a single continuous tone on plugging it in, so I quickly disconnected it. Too late - no more current at the plate with the meter in the IP setting (LSB mode, for 40M), no readings in the tune position for drive or plate, and of course no powe rout for CW using the straight key. (None at my SWR meter either - I am using an R7000, but have the SWR in line anyway).
So, I fear I have at the very least blown the final tubes with an HD-1410. By the way, the receiver seems to work ok (hard to tell because of band conditiosn lately!) Questions for the group:
Am I wrong about the HD-1410? I thought it was built to accomodate grid block keying. (I wonder (too late) if perhaps the particular unit I have was modified to work with later rigs.)
Could I have lucked out and simply blown a fuse? I am not aware of any fuse in line near the key input.
I don't have a sufficient background to even think about doing my own repairs. There are some fellow hams here in Chicago, who could help me out, but I am seriously thinking of sending the rig to Ken K4EAA. Any comments on this route? Has anyone had him work on a rig (esp the 520) with this type of problem? (There are some very minor issues with the front panel - the dial scale is not properly meshing with the sub-dial, but I can easily live with that).

I should add I am almost entirely a CW op. I've only had my ticket since 1998, but am an extra (the 520 is my first tube rig!). However, I'm a doctor, not an engineer! I like to think I know my limits, so am quite ready to have this repaired by someone else. I must say I really, really like the TS-520 - it meets my needs for what I want, in terms of CW operating - if I can get a keyer into it (I can do straight key work alright, but I really want to use a keyer).
Thanks!

I don't think 60 meters will be tunable without a realignment. At that you would only be able to do 60 and nothing else. You'd be disappointed I would think.

I don't use the auxillary postion myself.

11569. TS-520SE Plate Idle Current

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-19 01:02:35 UTC
From: baumbrent
Topic: 11569 Message: 11569

After replacing the 10 meter crystals over the weekend I decided I would check how the 520SE loads and tunes. I encountered a curious phenomenom and want to know if it is normal or if I need to do some more repair.

I set the frequency to the 20 meter band and adjusted the IP to 60ma, the Bias pot is as far down as it will go. When I switch through the other bands, without adjusting the Bias, I get the following:
Half hour warm up.
Radio off = 0 ma
Radio on = 20 ma mark(even when switched to ALC, IP, RF or HV when idling/receive mode)
1.8 LSB = 0 change(20 ma)
3.5 LSB = 70 ma
7 LSB = 40 ma
14 USB = 60 ma
21 USB = 40 ma
28 USB = 0 change (20 ma)
28.5 USB = 22 ma
29.1 USB = 0 change (20 ma)

Is this normal, do I need to adjust the Bias for each band? Or is something going away on me?

Also my audio seems way down, doesn't seem to have the same volume. And my meter when set in ALC never did seem to deflect when receiving even a very strong signal (no S units).

Thanks,
K7MEI, Brent

I think you made a left somewhere and I turned right...

Start over.

The bias is set in the SSB Mode while the radio is in TX and mike gain all the way down, counterclockwise.

The meter switch does nothing in RX mode it only indicates TX readings and only when it TX.

The reading you are getting in Rx is the AGC, not ALC, big difference.

Set the bias on 20m to 60ma IN SSB TX MODE using the bias pot on the side. It should be the same on all bands.

Clif

Otherwise we

Have 2 channel PC based scope good to about 20MHz.

> First, check to be sure that the 12BY7 is lit.
> Next check that the RF board is seated properly and all of the
connectors at
> the top of the board are properly seated.

12by7 is lit and rf board connectors reseated.

> There is a connection from a point on the coil pack board labeled
DRV to a
> feed through on the final cage wall. Be sure that this has not
broken off.

No visible connection on the top of the coil pack board (there is no wire wrapped around the DRV stake), but there is continuity from DRV on the coil pack to DRV on the final assembly. The connection must be from the underside of the coil pack board in my unit.

> Be sure that the VFO switch is straight up in the VFO position.
>

Straight up.

> Pin 1 of the 12BY7. This is the cathode. Correct reading is 0 V.

Tests at .3v in Tune Mode, SEND (All voltages WRT the chassis ground lug)

> Pin 2 of the 12BY7 This is the control grid, should read 4.3 volts
or 10 V.
> Check it with drive control up and down.
>

Hmmmm, reads -43v in REC, +.4 in Tune/USB, SEND, and +.3v in CW, SEND. CAR control has no affect.

> See if you can hear the carrier on a nearby receiver.
>

Can hear a weak carrier in CW, SEND. Not heard (or is very weak) in Tune/USB, SEND.

OK, where should I stick that probe?

11572. Re: TS-520 transmitter knocked out by HD-1410

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-19 03:05:46 UTC
From: w5rkl
Topic: 11553 Message: 11572

The HD-1410 can key 300VDC at 200ma positive keying voltage and
200VDC at 10ma negative keying voltage.

The HD-1410 keyer does not output a voltage on the keying output
jack that can distroy a 6146 final tube. The normal circuit operating
voltage used in the HD-1410 is 5VDC.

There are no jumpers to set to switch between positive
or negative keying. Diodes D4 and D5 automaticlly select the
keying polarity. There may be an occasion when a transmitter requires
the key line to be a few tenths of a volt from ground. If that is the
case, remove R27 and D5 and replace them with a wire jumper.

The HD-1410 resets itself when power is applied. You may or may not
hear a momentary tone, mine sends "N" -. when it's powered on. This
is normal. If your HD-1410 outputs a steady tone when powered on, try
momentarily pressing one of the paddles, this should stop the tone.
If it doesn't then other problems such as a bad IC3, keying
transistors etc, are bad. Also check the speed control to ensure it's
not pulled out. The speed control, when pulled out, keys the output
for tuning the transmitter.

Hope that provides some help with your problem.

Thanks, Clif. I knew that, for some reason I'm stupid around the radio tonight. All is right in the world of IP now.

Tuning around the dial I hear noone. Either the bands are absolutely flat or I need to get out in the daylight and check my dipole. I did hear some CW on 40 a while back.

Hi Brent. Tuning around on 80 just now I hear a few conversations going on. 40 is dead except for broadcast stations. Probably the higher bands are all dead too. That solar flare last Friday is still messing things up bad.

11575. RE: [TS-520_820_530_830] Pesky S-Meter (TS830) -- Surprise Ending

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-19 04:07:35 UTC
From: Ron Hauser
Topic: 9948 Message: 11575

I'm posting this for the amusement of all and so that this long thread has a conclusion in case others follow the same troubleshooting path.

This last weekend my father in law, Fred, who is a retired broadcast engineer and long time ham, was visiting so I showed him what I was doing with this radio. First, I showed him the low voltage result on the AGC line that is supposed to be 2.9v at Q11. After some noodling around in the shop, he pointed out that I was using a plain old DVM for this measurement, and it was pegging the S-meter. So we switched to my VTVM (duh!!!) and the VTVM did not peg the meter, it did not drag the circuit down, and it measured ... 2.9v. So the voltage on the AGC line is fine, I was on a wrong track.

Fred and I then started from scratch looking at the symptom and the signals. I have always thought from listening that the radio was plenty sensitve, that it was hearing good. But in the spirit of starting from scratch, we set it up using an A/B switch and compared with another TS830. This rig is _not_ hearing good, the receive sensitivity is down 20db or so. I don't have a signal generator so this was not easy for me to detect with the ear. We are going to confirm it this coming weekend as I will be visiting for the holiday and we are going to continue with his signal generator.

This sort of explains why I wasn't finding any bad components in the AGC circuit -- it wasn't malfunctioning. It also leads to the next area of testing and troubleshooting, the RF board and front end.

Subject: [TS-520_820_530_830] Pesky S-Meter (TS830)

Hi Rick, long time no troubleshooting on this S-meter problem. I recently started correspondence with Tim KA9EAK who reports a similar problem. I took a break from this effort and now that I have some vacation time coming up for the holidays I am revisiting it.

Summary: The symptom is a "dead" S-meter response, the S meter only responds to very big S9++ signals. I tried the S-meter calibration procedure in the operators manual but that did not provide additional sensitivity. I then started testing voltages on the IF board around Q11, Q12 and found that the AGC line that is supposed to be 2.9v at Q11 is low (1.12v). This same low voltage is seen at the plug #15 wire 3 from the RF board., and on over to Q1 on the RF board. Measured(nominal): 12.09(12.4), 0.99(1.0), 0.86(2.7), 0.68(1.1[-2.9]). I tested quite a few components in that area and didn't find anything taking this signal down, so I worked back

the other way and measured voltages around Q9 and Q10 on the IF board.
Again I have some discrepancies from nominal, I tested a bunch of components
but didn't find a bad one. I also verified the 9.0v and 3.6v supply, and
deoxit-ed board connections.

At this point I have a lot of measurements and I have tested quite a few
components, but I am not finding the problem because I lack basic
understanding about the radio design. I possibly also lack understanding of
electronics (!) as I've only been a ham for two years. Probably I have too
much data. And not enough critical thinking.

Something is pulling the AGC line down from 2.9v to 1.12v and I'm getting
stuck (but I am having fun poking around in the radio, reading the
schematic, and studying the manuals). Rick, or anyone else, got any ideas?

Thanks!!!

Subject: RE: [TS-520_820_530_830] Pesky S-Meter (TS830)

Hi Ron,

Yes, I had a shorted ceramic but it wasn't a dead short. It had about 3k
resistance if I remember right so it pulled the circuit down but not enough
to make it quit all together. Have you checked the voltages on your AV-AVR
board to make sure you have exactly 3.6v and 9v? I would check the
by-pass caps, There aren't that many of them nor are there any other ground
paths in the AGC circuit so you may be able to check resistance with out
lifting them.

Lamar, Colorado

Ron Hauser <eichmann@...> wrote:

Ok we are getting somewhere now. I do _not_ have the 2.9v on the AGC
line
coming into the IF board (0.00v). Likewise 0v on the RF board
connector #5
pin 1. Working back to Q1 on the RF board, 0 volts on this same
lead,
supposed to be 2.7v on the schematic. When you said you had a bad
disk
ceramic shorted to ground, was it the C45 right here? Unless a
better
recommendation appears I'll lift C45 and R12 to test...

To: Ron Hauser
Subject: RE: [TS-520_820_530_830] Pesky S-Meter (TS830)

Hi Ron,

OK on the voltages ...I would pull the wire plug off of connector #15 on
the IF board and check pin 3 on the plug. . This is the AGC line that brings
the 2.9v onto the IF board. If it checks out for 2.9v then somethng on the
IF board is dragging it down. If it is still 1.12v, than the problem is NOT
on the IF board. The AGC line comes from the RF Board (connector # 5 pin 1).
I am sending a shot of the RF board.... I had a bad disc ceramic capacitor
one time that was shorted ...Drove me nuts until I finally found it.

The AGC line on the I F board goes to Q4, Q8 and Q10 plus Q11 and Q12 that
you already checked. I would check the bypass caps off the transistors the
AGC line goes to and C177 and C184 on the end leg of the AGC to the left of
Q31

We having fun yet?

Lamar, Colorado

Ron Hauser wrote:

Hi Rick, thanks for pointing me to Q11 and Q12 on the IF board... I had
"almost" figured out that is where I want to look.

First I checked the TX/RX relay contacts, and gave them a cleaning with a
piece of paper and some Deoxit. It was looking very bright and shiny when I
opened it up, and I did not get a change in behavior.

Next I checked voltages around Q11, Q12. The supply to R73 and Q11 is 8.98v
(ok). The three leads of Q12 are 0v (ok), 4.24v (4.3v specified as nominal)
4.87v (4.8v specified). That seems pretty close. The two leads of Q11 were
5.92v (5.7v specified), and 1.12v (2.9v specified). That seems to be a

problem.

I also checked the resistors around VR2, VR3. I pulled R72, R73, R74
off
the board but all checked out within tolerance. Interesting note,
the
schematic has an error, it has R92 as a typo for R72, that was a
nice bit of
confusion.

I'm thinking that I'm onto something with the values around Q11 but
now I'm
back to poring over the schematic trying to decide where to go next.

BTW, When I go through the calibrate procedure for the S meter I
never get
more than S4 as the biggest peak on the calibrator signal.

Thanks for the help, and any more ideas will be welcome!

11576. TS-830 RF Board L3, L4 needed

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-19 04:31:06 UTC
From: Ron Hauser
Topic: 11576 Message: 11576

So when it turned out that my problem wasn't in the AGC or on the IF board, I started at the antenna and the RF board. I tried to go through the alignment of the ANT and MIX coils, using my RF probe to peak the signal. Well, the ANT coils didn't give any response, couldn't find a peak. The MIX coils would peak, and better as I went up the bands to higher frequency.

So I poked around at TP1, TP2 and I was really not getting RF when I had a nearby transmitter on (I was using my MFJ-259 antenna analyzer with a rubber duck dummy load to get a signal). Gordon had reported a dead receive and found L41 shorted. I attempted to check the 8.83M traps L3, L4. However, I couldn't get them to turn with an alignment tool, even after applying some WD40. Finally I pulled L3, L4, L41 out of the board. L41 ohmed ok, continuity on each side and no continuity across to the other circuit. L3 and L4 both had one winding open, one with continuity. So I took the cans off of these and they were somewhat fried. The reason that I couldn't turn L4 was because all the plastic insulation material in side had melted and slagged to one side. The wires were a mess also. L3 was also melted but not quite into such a mess, I could still see how it was supposed to go. I am guessing this radio took some kind of front end overload? Perhaps a lighting strike or something. Anyway, that brings me to the question...

Anyone have a parts RF board that has L3, L4 that I could purchase? Or alternatively, any advice on finding replacements. Thanks!!!

First, check the switches on the back. Be sure that the SG switch is on.
Be sure that the antenna switch is set to Normal.
If your rig has a Xverter switch, be sure it is off.

Be sure that the VFO switch on the front is straight up in VFO.

Some of these switches may have been bumped when you un-plugged the key.
When tuning up with no key plugged into the key jack, be sure that the carrier control is fully up.

If none of the above helps, there are internal contacts in the key jack that close when there is no key. There may be a problem with one of those contacts that coincidentally occurred at the same time you tried the keyer. All this keyer would have done is simulate a closed key. It should not have caused harm.

Try whistling into the mike on SSB with the mike gain up and see if you get any output indication.

If none of the above helps, let us know and we will go further.

Well there's more people here in the group that can help you that way. Ken is one person who could do the job. There are others like Cliff Holland have a shop too.

But before you go that path, see what comes back from the group. Now's the time when you get to see this resource at work. Give Walt or one of the moderators a chance to comment. This is where you have a learning opportunity. Others here have 520 also or have had them like James. You may still be able to do this yet. Let's see.

magicalmichaelmerlin <magicalmichaelmerlin@...> wrote:
I'm new to the reflector and would appreciate some thoughts on my
situation. I purchased a TS-520 at our club's auction last week. I
was able to tune the finals without any problem, using a straight
key. I made a single QSO, but with a 599 report.
I am aware of the -65V grid block keying set-up of the 520. I
thought I would be alright plugging in a Heathkit HD-1410.
Unfortunately, all I got was a single continuous tone on plugging it
in, so I quickly disconnected it. Too late - no more current at the
plate with the meter in the IP setting (LSB mode, for 40M), no
readings in the tune position for drive or plate, and of course no

powe rout for CW using the straight key. (None at my SWR meter
either - I am using an R7000, but have the SWR in line anyway).
So, I fear I have at the very least blown the final tubes with an
HD-1410. By the way, the receiver seems to work ok (hard to tell
because of band conditiosn lately!) Questions for the group:
Am I wrong about the HD-1410? I thought it was built to
accomodate grid block keying. (I wonder (too late) if perhaps the
particular unit I have was modified to work with later rigs.)
Could I have lucked out and simply blown a fuse? I am not aware
of any fuse in line near the key input.
I don't have a sufficient background to even think about doing my
own repairs. There are some fellow hams here in Chicago, who could
help me out, but I am seriously thinking of sending the rig to Ken
K4EAA. Any comments on this route? Has anyone had him work on a
rig (esp the 520) with this type of problem? (There are some very
minor issues with the front panel - the dial scale is not properly
meshing with the sub-dial, but I can easily live with that).

I should add I am almost entirely a CW op. I've only had my
ticket since 1998, but am an extra (the 520 is my first tube rig!).
However, I'm a doctor, not an engineer! I like to think I know my
limits, so am quite ready to have this repaired by someone else. I
must say I really, really like the TS-520 - it meets my needs for
what I want, in terms of CW operating - if I can get a keyer into it
(I can do straight key work alright, but I really want to use a
keyer).
Thanks!

In tune, Carrier fullup, Transmit.

Using a 10 x probe if you have one and the scope input on AC not DC, look at the RF level at the grid of the 12 BY7 pin 2. Now look at the plate of the 12BY7 pin 7. If you do not have a X10 probe, you should place a capacitor with a high enough voltage rating to handle the voltage on the plate in series with the probe. With a X10 probe, the internal resistance should be satisfactory. Or check your scope manual and see how high voltage that you can have on the input.

If you have RF on the plate, see if it can be peaked with the drive control. Then place the probe on the DRV point on the bottom of the final board and see what you have there.

Back to the RF board, At the RF-1 connector compare RF signal levels at TIF (10) and VCO (4) points. They should be in the ballpark of the same level. I am thinking TIF might be way low, almost as low as it would normally be in receive.

Let me know.

Otherwise we

Have 2 channel PC based scope good to about 20MHz.

> First, check to be sure that the 12BY7 is lit.
> Next check that the RF board is seated properly and all of the
connectors at
> the top of the board are properly seated.

12by7 is lit and rf board connectors reseated.

> There is a connection from a point on the coil pack board labeled
DRV to a
> feed through on the final cage wall. Be sure that this has not
broken off.

No visible connection on the top of the coil pack board (there is no wire wrapped around the DRV stake), but there is continuity from DRV on the coil pack to DRV on the final assembly. The connection must be

from the underside of the coil pack board in my unit.

> Be sure that the VFO switch is straight up in the VFO position.
>

Straight up.

> Pin 1 of the 12BY7. This is the cathode. Correct reading is 0 V.

Tests at .3v in Tune Mode, SEND (All voltages WRT the chassis ground lug)

> Pin 2 of the 12BY7 This is the control grid, should read 4.3 volts
or 10 V.
> Check it with drive control up and down.
>

Hmmmm, reads -43v in REC, +.4 in Tune/USB, SEND, and +.3v in CW, SEND.
CAR control has no affect.

> See if you can hear the carrier on a nearby receiver.
>

Can hear a weak carrier in CW, SEND. Not heard (or is very weak) in
Tune/USB, SEND.

OK, where should I stick that probe?

I don't think 60 meters will be tunable without a realignment. At that you would only be able to do 60 and nothing else. You'd be disappointed I would think.

I don't use the auxillary postion myself.

OK Walt, here we go:

At 7.050MHz and using 1X probe (and series .001uf cap for the plate measurement only):
- 12by7 grid shows .12 vrms at 7MHz, CAR at 10, SEND
- 12by7 plate shows 1.8 vrms at 7Mhz, CAR at 10, SEND (drops to 20 mv rms with at CAR 0)

> If you have RF on the plate, see if it can be peaked with the drive control.

Can peak (to 1.8 vrms), drops lower at Drive control extremes.

>Then place the probe on the DRV point on the bottom of the final
>board and see what you have there.

DRV on final board measures 1.3 vrms at 7MHZ

> Back to the RF board, At the RF-1 connector compare RF signal levels at TIF (10) and VCO (4) points. They should be in the ballpark of the same level. I am thinking TIF might be way low, almost as low as it would normally be in receive.

The AUX band position is for receive only. A specific frequency range coil pack, PLL and front end components must be installed before the AUX bandswitch position will work. Page 11 in the 830 manual gives a brief discription of the AUX position.

I always wondered about the AUX position only working on receive as there is an AUX position in the Drive Coil section of the RF board (which are adjusted for max ALC in transmit). When I had my original 830S back in 1982, I installed two additional WWV frequencies as it is tough to copy WWV here in Colorado on 10 mhz. I installed 2.500 mhz in the AUX position and I remember I had to order the coilpack and PLL components from Kenwood parts and it was a real pain to do. I also put a 15.00 mhz crystal in the Fixed position (WWVH) that I bought from International Crystal in Oklahoma City. Both worked but the sensitivity was about 10dB down from normal ham frequencies. Somewhere out there is this 830S with the additional freqs in it. Anyone in the list have it?

I quote from the 530 'book'

An AUX receive band is also available.
Coilpack [receiver front end] and PLL components must be installed and
aligned for specific receive frequency range desired.

So ....It is RECEIVE ONLY !!

Hi Ron. You might go here:
http://www.k4eaa.com/index.html
and email Len about the parts you need. He may have them, as he does
repairs and restorations to these rigs. He is also very helpful.

Good Luck!

Since it melted L3-L4 and that indicates a large overload "read
Lightning" these parts are also normally damaged. Although L41 may ohm
good I doubt it, it usually goes before L3-L4.

Parts:
L1 2.2 uH choke
L2 4.7 uH Chole
L3 L34-0559-05
L4 L34-0558-05
L41 L34-2004-05
C1 CQ92M1H182K 1800pf poly
C2 680pf disc
C3 470pf disc
C4 CQ92M1H152K 1500pf poly
C6 CC45RH1H101 100pf disc
C7 CQ09S1H122K 1200pf poly

I realize this is kinda the shotgun approach but you can go into it
several times and keep replacing or do it once and go on. I've been
thru the step by step enough times to know you won't be replacing too
many parts that are not needed and they are all cheap except the
Kenwood coils.

Ron,
I have an extra L4 here. I am in the process of buying a complete RF board and an IF board for the 830, but that deal isn't complete yet. Let me know off list if you are interested in the L4 I have here, and we can work something out.
On the 830 I had that was hard of hearing, It would hear really strong stations but not much else. On That one the L41 ohmed shorted from any terminal to any other. When I opened it up, it was cooked but L3 and L4 were ok !

11589. My Newest TS-830 Project

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-20 03:47:32 UTC
From: Gordon
Topic: 11589 Message: 11589

I just made a deal and purchased a NON-working TS-830s Gold for a parts rig. Nice, it came with ALL the filters and the guy threw in a VFO-230.
I received it via UPS last night. I hate to commit anything to the bone yard if I can prevent it. Today I placed it on the bench. NO Receive and NO transmit. I found that all the panel lights were burnt out. I replaced all of them and at least had light. The digital display worked. I started doing some checking today and found that the 9 volt supply was high. I adjusted it back to 9 volts, No Problem. I then checked the 3.6 volt supply. Whoa ..... It was 9 volts..... I could NOT adjust it down. I checked all the connectors on the AF board and all were good. I checked VR3 and it was good and clean.
I followed the circuit schematic and was able to locate the problem by inspecting the components.
Anyone want to take a quess what it was ???
I will let you know after I get some guesses.

One reason it didn't transmit was that there were NO tubes, but I knew that when I bought it. I installed good tubes but still No ALC and NO transmit. Voltages to the Final unit looked within specs.
I will fill you in on the TX part tomorrow.

73,
Gordon

11590. Looking for tuning knob

Hi Group

This is an interesting topic that Walt has raised, and I'd like to hear about others' practice. I always shiver slightly whenever I turn on any hefty piece of electronics, imagining huge inrushes of current into transformers and capacitors, dielectrics creaking with huge voltages suddenly appearing across them and stresses from changing temperatures. There's no doubt that turn-on is the most stressful time for electronics, and following that theory, leaving gear on 24/7/52 is the best idea.

Having said all that, I don't leave my 530S on for any period when I'm not around. As Walt suggests, with older gear where you've probably got lots of components drawing towards the ends of their lives, it's probably better to reduce working hours as much as possible. Or is it?

My main worry is that something's gonna start smoking when I'm not around and I'll end up with fried transformer or worse.

Food for thought.

Another topic: i'd like to thank everyone who has contributed this year, my first with the group. i know it's been said many times, but it's been an absolute delight for me to witness the sharing of knowledge and experience that goes on here as an everyday thing. I've learned lots about my dear old 530 and electronics in general. Bloody marvellous! I hope everyone has a happy and peaceful Christmas. And don't forget to turn the radio off.

Regards to all
Geoff VK2HQA

I used to leave everything on 24 hours a day until one day I was doing nothing and all of a sudden my TS-520SE went POP POP POP POP and smelled of smoke. I'm glad I was home to shut it off. Ever since then I've turned the stuff off at night or when I am going to be gone.

Now my computer stuff on the other hand I leave on all the time.

Years ago, at work, I smelled smoke. Quickly traced it to an unattended PC that was left on 24/7. The PS went. Fortunately, I was there to just pull the plug. Had nobody been there, we might have had a fire.

At home, do I want my PC running all the time? Yes, but I don't want the fire risk of an unattended electronics "thing" so I turn it off at night when the family is asleep. Same with the ham gear.

Well gang, I have a ts830 s here that has a billiom trillion hours
on it.....I never turn it off unless I do maint on it or there is a
bad electrical storm .I ALWAYS leave it on , even when I'm away from
home for days.....guess I feel lucky, or have faith.
I listen to a service net daily , as it operates through out the day
from early morn to late in the evening, so I simply leave the radio
on. I am also net control at time for this group.....and the 830 has
racked up many transmit hours .
Mind you , this has been 24 / 7 for the last 15 years , if not more.
I have never had any problems of any nature.....
All the lite bulbs in the s meter / dial still original.
Digital read out....still good.
HV ....still where it should be.
I replaced finals / driver when power dropped to 80 watts key down.
At nite....I turn the heater switch off.
Every year , I do reg maint on it.....I pop the hood..... blow it out
gently with computer spray air. I lightly spray de oxit on any
control's that I feel might need it. MOST importantly is oiling the
fan with a few drops of lite oil....I even give it a shot of de oxit
to mix with the oil. The fan must work at all times !!!! It's gotta
have air through it.

I have many radios here....even a few high end radios for dx'ing
etc.....but the older series of Kenwood TS radios are hard to beat.
Yes I have replacements for the main 830 if it should ever fail....
Spank'n brand new one in the box....that I turn on every month.
Another stand by 830.....plus a stand by 820....thats 4 Kenwoods.

Of any radio of any mfr....OLD / NEW....I'd take the time proven TS
series of Kenwood.

Amen to that!!! I owned a TS-520 in 1976 (sold it and it's STILL going), a TS-820 (wished I never sold it) and I now own three TS-830Ss ... one's damaged and I use it for spare parts, and the other two are still going strong.

My only complaint is the bandswitches do wear out, otherwise, great rigs.

Well gang, I have a ts830 s here that has a billiom trillion hours
on it.....I never turn it off unless I do maint on it or there is a
bad electrical storm .I ALWAYS leave it on , even when I'm away from
home for days.....guess I feel lucky, or have faith.
I listen to a service net daily , as it operates through out the day
from early morn to late in the evening, so I simply leave the radio
on. I am also net control at time for this group.....and the 830 has
racked up many transmit hours .
Mind you , this has been 24 / 7 for the last 15 years , if not more.
I have never had any problems of any nature.....
All the lite bulbs in the s meter / dial still original.
Digital read out....still good.
HV ....still where it should be.
I replaced finals / driver when power dropped to 80 watts key down.
At nite....I turn the heater switch off.
Every year , I do reg maint on it.....I pop the hood..... blow it out
gently with computer spray air. I lightly spray de oxit on any
control's that I feel might need it. MOST importantly is oiling the
fan with a few drops of lite oil....I even give it a shot of de oxit
to mix with the oil. The fan must work at all times !!!! It's gotta
have air through it.

I have many radios here....even a few high end radios for dx'ing
etc.....but the older series of Kenwood TS radios are hard to beat.
Yes I have replacements for the main 830 if it should ever fail....
Spank'n brand new one in the box....that I turn on every month.
Another stand by 830.....plus a stand by 820....thats 4 Kenwoods.

Of any radio of any mfr....OLD / NEW....I'd take the time proven TS
series of Kenwood.

11602. Re: TS-520 transmitter knocked out by HD-1410

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-20 16:20:31 UTC
From: magicalmichaelmerlin
Topic: 11553 Message: 11602

Thanks, Walt.
The SG switch is on. I don't see an antenna switch on the back of the TS-520, but I seem to be receiving ok. Ditto with an Xverter switch.
The VFO switch is straight up in VFO.
By the way, Ken Kemski had essentially the same idea - that maybe some of the switches were bumped - but nope.
Visual inspection of the internal connections on the key jack don't show a problem, but I haven't been able to insert a meter probe into them.
By the way, Ken also asked about the HV status. When I switch the meter to read HV, the meter pins to the right (which I assume is normal).
Still no go - no current to the plate at all and no power out when in TUN function with SEND (for LSB mode), as there had been before the incident with the keyer.
I haven't checked the HD-1410 yet, but what I find strange is that the HD-1410 speaker was giving dits and dahs at the exact same time the TS-520 speaker was giving a continuous tone. And, by the way, the HD-1410 has no "hold" knob for keying up a rig. What it has is a pull out of the knob controlling either volume or speed (I forget which) - and it definitely was not pulled out when I had plugged it into the key jack of the 520.
I'm going to ask a friend in our club to open the high voltage box up and see if the cathode resistor is shot, which Ken thought might have happened.
Again, thanks for all the thoughts and suggestions.

you tried the keyer. All this keyer would have done is simulate a closed key. It should not have caused harm.

Ok the answer to 9 volts on the 3.6 volt line was due to a broken R15
3.3 k resistor that comes off the RF gain control to ground. This was
a new problwm for me and I am sharing in case someone else runs into
this same problem.

I feel that if a piece of gear is going to fail, it doesn't matter whether it is a piece of vintage gear or any of the modern day high priced gear and every piece inbetween.

I firmly believe the longivity of any ham electronic equipment is based on how it's treated/mistreated and/or maintained, something I learned in 22 years of military service. A good maint plan goes a long way in keeping ham gear working and working properly.

I do not believe leaving a piece or pieces of ham gear powered on 24/7 has any useful purpose. Others may disagree and that's fine. That's why I turn my gear OFF when it's not being used, during thunder storms or I'm not going to be home.

Merry Christmas and Happy New Year. :)

I have a master switch at my service bench and one at the operating area.
When I'm not there, asleep, washing the dog, cleaning the gutters, etc.
the master switches are always in the OFF position. Besides the threat
of a "flame-up", "pop-out", or some other nasty failure, it makes no
sense to me to waste electricity, much less also to have to pay for it.
Same is true for all the computer stuff; if I'm not there, it's off.

NO !!!!!!!

If it pegs hard over, you have a problem - should 'hover' between
800/900 volts.

From: Kevin
Topic: 11439 Message: 11610

I purchased my 830 new in the early 1980's.
I have been turning this rig off/on at least once to several times a day for close to 25 years. In the early days I left the rig on for longer durations. Setting there tuning for long periods for DX. After packetclusters arrived I am able to hear the filtered DX spot in other parts of my house so if it's something I need (I don't really get that many spots for band countries anymore) I go in and work them, turn the rig off again and go about my business. So this has been taking place for, I'm guessing, for over 10 years now. Sometimes the rig may get turned off and on half a dozen times a day I would think. Others just once while I feel like setting there and tune through the bands for before or after work.

I have only replaced the tubes once.
Replaced one component.

Have I just been lucky?
73 Kevin.

I use a strip to turn rig and keyers all off.

11611. TS-830S - Digital Display, 10Hz Position.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-20 22:54:35 UTC
From: Kevin
Topic: 11611 Message: 11611

Hi All,

Was looking at my radio, and noticed that the display has the 10Hz
position on it, however it is not lit.
Did some checking of the schematic and messages and could not determine
whether this digit could be made to work.
The counter board shows a 6 digit output to the display, so guessing
that it does not work, but wanted to ask the question.
Can it be made to display?

Not that it is a issue, I don't really need it, just that it is there,
and with all the newer radios going down to 1Hz, the 10Hz when fine
tune it.

Regards

Kevin, ZL1KFM.

Now looking for my next TS-830S :)

I guess this disproves the old theory of stripping the plate by
leaving the power on when the heaters are off.

To: TS-520_820_530_830@yahoogroups.com
Subject: [TS-520_820_530_830] Re: TS-830 RF Board L3, L4 needed

Since it melted L3-L4 and that indicates a large overload "read Lightning" these parts are also normally damaged. Although L41 may ohm good I doubt it, it usually goes before L3-L4.

Parts:
L1 2.2 uH choke
L2 4.7 uH Chole
L3 L34-0559-05
L4 L34-0558-05
L41 L34-2004-05
C1 CQ92M1H182K 1800pf poly
C2 680pf disc
C3 470pf disc
C4 CQ92M1H152K 1500pf poly
C6 CC45RH1H101 100pf disc
C7 CQ09S1H122K 1200pf poly

I realize this is kinda the shotgun approach but you can go into it several times and keep replacing or do it once and go on. I've been thru the step by step enough times to know you won't be replacing too many parts that are not needed and they are all cheap except the Kenwood coils.

Clif

MAGICOM
RF PROCESSOR FOR THE TS-820

Does any one know anything about the Magicom "RF Processor for the TS-820". I've found one in my 820, never knew it was there, and now it's in the middle of a trouble shooting project that I have going on.
WB2JKJ,
http://www.hamradiomanuals.com/view_manual.php?m=144&PHPSESSID=b0f93f68d406401ed9e7a7d6a346aab5
has what I believe to be the manual but wants $16.00 for it. I would like to take a look see for a little less than that. Any help would be appreciated.

Topic: 11611 Message: 11619

Kevin, the counters are built that way from the manufacturer. Someone else mentioned this recently also.

Unless you want it to read a zero, you may not find it worth turning on. That's a digits position of such small proportion that it's not worth the effort. The counter gets you in pretty close to where you want to be. Compare it against an analog dial sometime to get a feel for the difference.

Kevin <sparcnz@...> wrote:
Hi All,

Was looking at my radio, and noticed that the display has the 10Hz
position on it, however it is not lit.
Did some checking of the schematic and messages and could not determine
whether this digit could be made to work.
The counter board shows a 6 digit output to the display, so guessing
that it does not work, but wanted to ask the question.
Can it be made to display?

Not that it is a issue, I don't really need it, just that it is there,
and with all the newer radios going down to 1Hz, the 10Hz when fine
tune it.

Regards

Kevin, ZL1KFM.

Now looking for my next TS-830S :)

Boy, thats an uncommon one. Was it broken because of some mechanical force against it?

Gordon <n6wk@...> wrote: Ok the answer to 9 volts on the 3.6 volt line was due to a broken R15
3.3 k resistor that comes off the RF gain control to ground. This was
a new problwm for me and I am sharing in case someone else runs into
this same problem.

From: John Harp
Topic: 11569 Message: 11621

no your right something is off. Don't use the transmit any more than you need to right now. Something may be out of alignment.

baumbrent <brentbaum5323@...> wrote: After replacing the 10 meter crystals over the weekend I decided I
would check how the 520SE loads and tunes. I encountered a curious
phenomenom and want to know if it is normal or if I need to do some
more repair.

I set the frequency to the 20 meter band and adjusted the IP to
60ma, the Bias pot is as far down as it will go. When I switch
through the other bands, without adjusting the Bias, I get the
following:
Half hour warm up.
Radio off = 0 ma
Radio on = 20 ma mark(even when switched to ALC, IP, RF or HV when
idling/receive mode)
1.8 LSB = 0 change(20 ma)
3.5 LSB = 70 ma
7 LSB = 40 ma
14 USB = 60 ma
21 USB = 40 ma
28 USB = 0 change (20 ma)
28.5 USB = 22 ma
29.1 USB = 0 change (20 ma)

Is this normal, do I need to adjust the Bias for each band? Or is
something going away on me?

Also my audio seems way down, doesn't seem to have the same volume.
And my meter when set in ALC never did seem to deflect when
receiving even a very strong signal (no S units).

Thanks,
K7MEI, Brent

From: John Harp
Topic: 9948 Message: 11622

Yes Ron, high impedance meter will load a circuit down less. As you can see it does make a difference.

Ok, so maybe it's time to invest in a signal generator. But do keep a high VTVM handy, an oscilloscope is nice that way too.

Ron Hauser <eichmann@...> wrote:
I'm posting this for the amusement of all and so that this long thread has a conclusion in case others follow the same troubleshooting path.

This last weekend my father in law, Fred, who is a retired broadcast engineer and long time ham, was visiting so I showed him what I was doing with this radio. First, I showed him the low voltage result on the AGC line that is supposed to be 2.9v at Q11. After some noodling around in the shop, he pointed out that I was using a plain old DVM for this measurement, and it was pegging the S-meter. So we switched to my VTVM (duh!!!) and the VTVM did not peg the meter, it did not drag the circuit down, and it measured ... 2.9v. So the voltage on the AGC line is fine, I was on a wrong track.

Fred and I then started from scratch looking at the symptom and the signals. I have always thought from listening that the radio was plenty sensitve, that it was hearing good. But in the spirit of starting from scratch, we set it up using an A/B switch and compared with another TS830. This rig is _not_ hearing good, the receive sensitivity is down 20db or so. I don't have a signal generator so this was not easy for me to detect with the ear. We are going to confirm it this coming weekend as I will be visiting for the holiday and we are going to continue with his signal generator.

This sort of explains why I wasn't finding any bad components in the AGC circuit -- it wasn't malfunctioning. It also leads to the next area of testing and troubleshooting, the RF board and front end.

Subject: [TS-520_820_530_830] Pesky S-Meter (TS830)

Hi Rick, long time no troubleshooting on this S-meter problem. I recently started correspondence with Tim KA9EAK who reports a similar problem. I took a break from this effort and now that I have some vacation time coming up for the holidays I am revisiting it.

Summary: The symptom is a "dead" S-meter response, the S meter only responds to very big S9++ signals. I tried the S-meter calibration procedure in the operators manual but that did not provide additional

sensitivity. I then started testing voltages on the IF board around Q11, Q12 and found that the AGC line that is supposed to be 2.9v at Q11 is low (1.12v). This same low voltage is seen at the plug #15 wire 3 from the RF board., and on over to Q1 on the RF board. Measured(nominal): 12.09(12.4), 0.99(1.0), 0.86(2.7), 0.68(1.1[-2.9]). I tested quite a few components in that area and didn't find anything taking this signal down, so I worked back the other way and measured voltages around Q9 and Q10 on the IF board. Again I have some discrepancies from nominal, I tested a bunch of components but didn't find a bad one. I also verified the 9.0v and 3.6v supply, and deoxit-ed board connections.

At this point I have a lot of measurements and I have tested quite a few components, but I am not finding the problem because I lack basic understanding about the radio design. I possibly also lack understanding of electronics (!) as I've only been a ham for two years. Probably I have too much data. And not enough critical thinking.

Something is pulling the AGC line down from 2.9v to 1.12v and I'm getting stuck (but I am having fun poking around in the radio, reading the schematic, and studying the manuals). Rick, or anyone else, got any ideas?

Thanks!!!

Subject: RE: [TS-520_820_530_830] Pesky S-Meter (TS830)

Hi Ron,

Yes, I had a shorted ceramic but it wasn't a dead short. It had about 3k resistance if I remember right so it pulled the circuit down but not enough to make it quit all together. Have you checked the voltages on your AV-AVR board to make sure you have exactly 3.6v and 9v? I would check the by-pass caps, There aren't that many of them nor are there any other ground paths in the AGC circuit so you may be able to check resistance with out lifting them.

Lamar, Colorado

Ron Hauser <eichmann@...> wrote:

Ok we are getting somewhere now. I do _not_ have the 2.9v on the AGC line
coming into the IF board (0.00v). Likewise 0v on the RF board connector #5
pin 1. Working back to Q1 on the RF board, 0 volts on this same lead,
supposed to be 2.7v on the schematic. When you said you had a bad disk

ceramic shorted to ground, was it the C45 right here? Unless a
better
recommendation appears I'll lift C45 and R12 to test...

To: Ron Hauser
Subject: RE: [TS-520_820_530_830] Pesky S-Meter (TS830)

Hi Ron,

OK on the voltages ...I would pull the wire plug off of connector
#15 on
the IF board and check pin 3 on the plug. . This is the AGC line
that brings
the 2.9v onto the IF board. If it checks out for 2.9v then somethng
on the
IF board is dragging it down. If it is still 1.12v, than the problem
is NOT
on the IF board. The AGC line comes from the RF Board (connector # 5
pin 1).
I am sending a shot of the RF board.... I had a bad disc ceramic
capacitor
one time that was shorted ...Drove me nuts until I finally found it.

The AGC line on the I F board goes to Q4, Q8 and Q10 plus Q11 and
Q12 that
you already checked. I would check the bypass caps off the
transistors the
AGC line goes to and C177 and C184 on the end leg of the AGC to the
left of
Q31

We having fun yet?

73' Rick KC0HH
Lamar, Colorado

Ron Hauser wrote:

Hi Rick, thanks for pointing me to Q11 and Q12 on the IF board... I
had
"almost" figured out that is where I want to look.

First I checked the TX/RX relay contacts, and gave them a cleaning
with a
piece of paper and some Deoxit. It was looking very bright and shiny
when I
opened it up, and I did not get a change in behavior.

Next I checked voltages around Q11, Q12. The supply to R73 and Q11
is 8.98v

(ok). The three leads of Q12 are 0v (ok), 4.24v (4.3v specified as
nominal)
4.87v (4.8v specified). That seems pretty close. The two leads of
Q11 were
5.92v (5.7v specified), and 1.12v (2.9v specified). That seems to be
a
problem.

I also checked the resistors around VR2, VR3. I pulled R72, R73, R74
off
the board but all checked out within tolerance. Interesting note,
the
schematic has an error, it has R92 as a typo for R72, that was a
nice bit of
confusion.

I'm thinking that I'm onto something with the values around Q11 but
now I'm
back to poring over the schematic trying to decide where to go next.

BTW, When I go through the calibrate procedure for the S meter I
never get
more than S4 as the biggest peak on the calibrator signal.

Thanks for the help, and any more ideas will be welcome!

11624. TS520 drive and reception issues

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-21 04:08:04 UTC
From: dug
Topic: 11624 Message: 11624

I have a TS520 that has been a workhorse for years. It's giving me some fits right now. I thought the driver was the culprit but after turning it on tonight I'm confused. The symptoms seem to keep shifting on me, so I'm missing something. Help?

Over the past month I've noticed that output has been dropping, even with fresh finals that have been neutralized. During tune-up procedure done as from the manual it's been giving less of a reading when adjusting drive. This weekend it gave □no- reading. Hence my thought of the driver. Now the oddities grow The SG switch was returned to proper setting after neutralization, btw.

Tonight I decided to use the rig for some listening while my XYL plays video games. SSB signals are booming in. Then I switch to CW and get silence on all bands. It doesn't seem to be a switch issue. The only thing I can get is some pop when switching the VFO knob. No, I can't test against the crystal calibrator. The previous owner disabled it somehow and the rig has always been so stable I haven't needed to troubleshoot it.

BTW, I've also noticed what seems to be □increased- sensitivity on reception over the same time period. It doesn't seem to matter much what setting the antenna tuner is in anymore; I notice only about one S-unit drop when on the dummy load. Removing the antenna from the ATU does affect things, as does removing the ATU from the rig. A different antenna tuner gives the same result. During the past month the radio has been exposed to some cold weather; into the 30's for a few nights. Could this have damaged some of the 33 year old capacitors?

When it comes to the innards of my radio I'm not the most clued in, so I realize that I've probably missed something really basic. Especially with the ATU; I hear a bell ringing in the back of my mind on that . That in mind, please be slow as to answering since my XYL is just about to say yes to a nice new ft897. I can fix this rig AFTER that.

73's and thanks in advance,
Doug KC4RSL

Goeff
This was just a flash fom the past. I took my training way back when tubes were king and there has been a lot of water under the bridge since then. In fact it's been 20 years since I looked at any component level electronics.
It was not plate stripping I was thinking of but should have read cathode stripping. It used to be common belief that applying power to the tubes without preheating the filaments would strip the cathodes of their emitting elements, for lack of a better description. A quick Google on cathode stripping reveals this only happens when the HV exceeds approx 10 KV. Should not be a problem for us.

Meter pinning on HV is not normal. Replace all of the resistors on the HV unit board with the exact same ohms and wattage.
Check R2 and R3, the cathode resistors on the Final Unit board. In circuit they should measure 5 ohms. They are two 10 ohm resistors in parallel. Or replace them with 10 ohm each 1 watt. Use only 1 watt. Increasing the wattage value of these resistors can cause serious damage if a tube shorts.

The HD 1410 was functioning properly, but it's switching kept the transmitter keyed continuously. That is why it was sending dits while the transmitter keyed continuously.

Subject: [TS-520_820_530_830] Re: TS-520 transmitter knocked out by HD-1410

Thanks, Walt.
The SG switch is on. I don't see an antenna switch on the back of the TS-520, but I seem to be receiving ok. Ditto with an Xverter switch.
The VFO switch is straight up in VFO.
By the way, Ken Kemski had essentially the same idea - that maybe some of the switches were bumped - but nope.
Visual inspection of the internal connections on the key jack don't show a problem, but I haven't been able to insert a meter probe into them.
By the way, Ken also asked about the HV status. When I switch the meter to read HV, the meter pins to the right (which I assume is normal).
Still no go - no current to the plate at all and no power out when in TUN function with SEND (for LSB mode), as there had been before the incident with the keyer.
I haven't checked the HD-1410 yet, but what I find strange is that the HD-1410 speaker was giving dits and dahs at the exact same time the TS-520 speaker was giving a continuous tone. And, by the way, the HD-1410 has no "hold" knob for keying up a rig. What it has is a pull out of the knob controlling either volume or speed (I forget which) - and it definitely was not pulled out when I had plugged it into the key jack of the 520.
I'm going to ask a friend in our club to open the high voltage box up and see if the cathode resistor is shot, which Ken thought might have happened.
Again, thanks for all the thoughts and suggestions.

Is this the manual for the Magicom he is wanting $16.00 for ? I think I can come up with one for $ 15.95.

Just joking, if I can find it I will make a copy and send it to you for free. It is a one or two page manual.
This is a device that makes the RF processor in the TS-820 a RF limiter. It is not all that bad. It was made by W6TOG and uses an FM limiter chip as the RF clipper. The number is rubbed off of the limiter chip and I have not been able to identify it.

Gordon was kind enough to send me one that I reverse engineered except for identifying the chip. I believe that the chip is the same at a TA7060P except that the TA7060P is an inline package and the chip in the Magicom is a round metal one.

As I remember. C-133 was removed to disable the gain reduction circuit in the original compressor and C-139 was removed. I believe that R-105 and R-110 may have also been removed. I believe that the input and output of the Magicom went to either side of where C-139 was. I believe there was a connection to the side of where C-133 was that goes to D-39 and 40. This makes the comp meter work. There is also either a 9 or 14 volt connection and the board is grounded where it solders to the back of the IF board.

To remove it, remove the Magicom board and all of the wires. Replace C-133 with a 22 pf ceramic disc capacitor. Replace C-139 with a .01 uf ceramic disk capacitor. Replace R- 105 and 110 with a 10 K 1/4 watt resistor each.

It works pretty good. Should it have a problem, it will only affect operation with the processor on.

This information is from memory and I am 57 years olde, so I cannot guarantee the accuracy of it.

BTW, if anybody knows the number of this chip i would find it interesting. I bet it was a common FM IF limiter in the day.

MAGICOM
RF PROCESSOR FOR THE TS-820

Does any one know anything about the Magicom "RF Processor for the TS-820".
I've found one in my 820, never knew it was there, and now it's in the
middle of a trouble shooting project that I have going on.
WB2JKJ,
http://www.hamradiomanuals.com/view_manual.php?m=144&PHPSESSID=b0f93f68d406401ed9e7a7d6a346aab5
has what I believe to be the manual but wants $16.00 for it. I would like to
take a look see for a little less than that. Any help would be appreciated.
Edwin

Subject: [TS-520_820_530_830] TS520 drive and reception issues

I have a TS520 that has been a workhorse for years. It's giving me some fits right now. I thought the driver was the culprit but after turning it on tonight I'm confused. The symptoms seem to keep shifting on me, so I'm missing something. Help?

Over the past month I've noticed that output has been dropping, even with fresh finals that have been neutralized. During tune-up procedure done as from the manual it's been giving less of a reading when adjusting drive. This weekend it gave -no- reading. Hence my thought of the driver. Now the oddities grow. The SG switch was returned to proper setting after neutralization, btw.

Tonight I decided to use the rig for some listening while my XYL plays video games. SSB signals are booming in. Then I switch to CW and get silence on all bands. It doesn't seem to be a switch issue. The only thing I can get is some pop when switching the VFO knob. No, I can't test against the crystal calibrator. The previous owner disabled it somehow and the rig has always been so stable I haven't needed to troubleshoot it.

BTW, I've also noticed what seems to be -increased- sensitivity on reception over the same time period. It doesn't seem to matter much what setting the antenna tuner is in anymore; I notice only about one S-unit drop when on the dummy load. Removing the antenna from the ATU does affect things, as does removing the ATU from the rig. A different antenna tuner gives the same result. During the past month the radio has been exposed to some cold weather; into the 30's for a few nights. Could this have damaged some of the 33 year old capacitors?

When it comes to the innards of my radio I'm not the most clued in, so I realize that I've probably missed something really basic. Especially with the ATU; I hear a bell ringing in the back of my mind on that.. That in mind, please be slow as to answering since my XYL is just about to say yes to a nice new ft897. I can fix this rig AFTER that.

73's and thanks in advance,
Doug KC4RSL

11630. Re: TS-520 transmitter knocked out by HD-1410

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-21 14:19:50 UTC
From: w5rkl
Topic: 11553 Message: 11630

When powering up the HD-1410 keyer, if the the keyers auto reset doesn't work and the keyer is sending constant dits or dahs, tap one of the paddles and it should stop the constant keying. If this doesn't work, it's possible the paddle adjustment lever has been moved too far to the left. Remove the top cover and move the thick black paddle adjustment lever to the right until the keyer stops. Be careful, the 120VAC fuse is mounted on the left side wall of the keyer.

If you suspect the PULL OUT switch is bad, you can disconnect one wire from this switch to test. The switch connections are located on the rear of the SPEED control. Simply unsolder one wire and if the switch is shorted internally, the keyer should no longer have a constant keyed output.

Replace the electrolytic caps. You can get most, if not all, of them at your local Radio Shack store. All but 2 are radial lead caps.

If the sidetone doesn't work but you can hear "clicking" in the speaker with one paddle pressed, the sidetone oscillator is not starting. Remove the bottom cover and adjust the TONE screw driver adjustment until the tone oscillator is heard with one paddle pressed.

Just a few tips for the HD-1410 keyer.

73's
Mike
W5RKL

From: n9wb
Topic: 11419 Message: 11632

On tune or CW, transmit Carrier fully up,

On IF3 On the IF board, connector IF3 Pin 2 is TIF. Use the scope to measure the level there. Find D-44 and measure the RF level on both sides of it.
Again, check the level at TIF on the RF board.

While in the same condition as above, check the DC voltage at these points. Then check the DC voltage of these points in the receive mode.

Using the scope, measure the signal level at pin 5 of the finals on the bottom of the final board.

Now, Change to the SSB mode, mike gain fully down.
On the RF 2 connector on the RF board, check the voltage at RLK (pin9). on both TX and RX.

Also measure the voltage on the anode side of D-1. This is the end that connects to R-5 and C-14. Transmit USB, no mike gain.

Recheck the voltage on pin 2 of the 12BY7. Transmit USB, no mike gain Transmit CW or Tune, and then on receive. The voltage at this point is hard to read even on an original manual. I believe that it is supposed to be +10 on transmit and - 43 on receive. I don't that is what you got.

Are you using a VTVM here ? If not also check these voltages on SSB with your scope. Do you know how to check DC voltages with a scope? the input has to be on DC instead of AC. The meter you are using may be affecting this reading, or low bias on transmit may be the problem. I assume that you have tried another 12BY7 since locating the bad R-13 ?

> the plate of the 12BY7 pin 7.

OK Walt, here we go:

At 7.050MHz and using 1X probe (and series .001uf cap for the plate measurement only):

- 12by7 grid shows .12 vrms at 7MHz, CAR at 10, SEND
- 12by7 plate shows 1.8 vrms at 7Mhz, CAR at 10, SEND (drops to 20 mv rms with at CAR 0)

> If you have RF on the plate, see if it can be peaked with the drive control.

Can peak (to 1.8 vrms), drops lower at Drive control extremes.

>Then place the probe on the DRV point on the bottom of the final
>board and see what you have there.

DRV on final board measures 1.3 vrms at 7MHZ

> Back to the RF board, At the RF-1 connector compare RF signal levels at TIF (10) and VCO (4) points. They should be in the ballpark of the same level. I am thinking TIF might be way low, almost as low as it would normally be in receive.
>

- VCO measures .4 vrms, REC OR SEND
- TIF measures 2mv rms REC, 20mv rms on SEND

> Let me know.
>

I think that covers the requested measurements, let me know if I left something out.

11633. How often to tune?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-21 13:53:16 UTC
From: Doug
Topic: 11633 Message: 11633

Hello,
I am new the the world of tubes. I understand the tune up procedure and have that down on my TS-820S. My question is if I tune up in one part of the band and change freq. in the same band, how far can I go before I should check everything and be sure it is adjusted correctly for the new freq? Had a solid state rig that went bad and with all the holiday costs, didn't have much extra cash to get another solid state rig. At first I thought it was going to be a pain, but I have to admit, it is kinda fun to have dials to mess with.

Topic: 11624 Message: 11634

OK, I swapped out for a third jumper between the ATU and the rig
with no change. I even no antenna. Maybe there's an issue with the
ATU? I'll straight line the antenna now that I've thought of then
blindingly obvious. No antenna was very little reception, but I
could pick up a few SSB signals on 20; probably normal.

Not that we expected it to, but just to be complete I'll say none of
these affected the lack of CW or the tune-up.

Courtney:

Things have hectic here lately, and I am not sure exactly how completely I replied to your questions.
One mod I would recommend it the following one. This is easily done and will make the transmit audio sound more open and less limited.

TS 830

This capacitor is labeled C-106. It is located on the IF board.
On the IF board there is a connector labeled 7. It is along side of CF 3. In that area you will find Q 19. C-106 is between Q 19 and the connector.

In the mid 1980s I believe 1986 Bob Heil published a construction project for an audio equalizer called an EQ-100. He also marketed it and a very similar upgraded one called the EQ-200. I have built a couple of these over the years. Bob's original version used 741 op amps. I used TLO 72 and 82 op amps instead as they have much better characteristics. for amateur use, I don't know it anybody could tell the difference, however.

This unit worked like a +/- Bass and Treble control on a radio except the frequencies were tailored for use with Amateur Radio audio frequencies. It would improve the sound of most mikes. I can no longer find the QST article but it was rather simple to build. I built one of mine on a breadboard. Perhaps Bob Heil still has some blank circuit boards around.

You also said that you had a IHY box. Do you still have any IHY boxes and if so which ones. We should be able to get one of those to sound good for you.

Perhaps this will be helpful information.

Subject: [TS-520_820_530_830] Kenwood TS-830 mods.

Hello all , i still cannot believe what a stir this has caused,
after I asked if there were any audio mods that we can do for the TS-830. i think after asking weather someone could help , I think we have drifded of the main subject.
N9WB wrote to me sayng he was making an eq possibly for the TS-830s, This would be fantastic and i will be His FIRST customer !! Getting back to transmit mods, im open to someone even doing the work for me as I do not want to take the chance to mess up a perfect radio that was extremely hard to find.

This is the site in question
http://home.comcast.net/~esprepair/ts830mods.htm

Now if you go into the site , right into it, he offeres a TX and RX
mod for FREE for the TS-520s , how nice of him .
site is as follows: http://home.comcast.net/~esprepair/ts520mods.htm

I can see now the 520s boys will be heading there directly, but can
some other tech look at this mod , and offer me some assistance
weather it would apply to the 830s?

Again , Im looking for someone to do a mod for ME as im not 100%
confident in doing it myself, The problem bieng im In AUSTRALIA and
this is where the problem starts and stops . A adjustable eq that
would pass the Front Mic socket would be perfect but as we all know
its the hard part.

Merry Xmas to all from down under
Dr Courtney McCarthy

OK, I swapped out for a third jumper between the ATU and the rig
with no change. I even no antenna. Maybe there's an issue with the
ATU? I'll straight line the antenna now that I've thought of then
blindingly obvious. No antenna was very little reception, but I
could pick up a few SSB signals on 20; probably normal.

Not that we expected it to, but just to be complete I'll say none of
these affected the lack of CW or the tune-up.

Topic: 11633 Message: 11638

Retuning depends how far, one way or the other, you move from the resonante frequency. For example, if you move up 25Khz from the resonate frequency, I would touch up the tuning. However, if you move just a few Khz, I see no need to adjust the tuning.

If you are using a tuner, look at the tuner's SWR setting for an increase in SWR. For example, a slight increase from 1.1 to say, 1.3 to 1, does not warrant an adjustment in the tuner. Most modern solid state rigs with built-in tuners will follow the frequency change and automatically adjust accordingly. Most vintage as well as modern day transmitters/transceivers can tolerate an SWR from 2.1 to 1 and lower. Of course the SWR circuitry in modern transceivers will lower the output power as the SWR increases. Having said that, an increase from 1.1 to 1.3 to 1 SWR will not change the power output significantly. I'm sure the receiving end would not even notice it.

I am not saying an SWR of 2.1 to 1 is an acceptable level; not at all. I'm simply repeating what you will read in the manual. If the SWR is 2.1 to 1, that warrants touching up on the tuner as well as the transmitter. Modern all solid state rigs don't require touch up tuning; only a tuner if the tuner is seperate from the transmitter.

This week my elderly Father age 87 developed Pneumonia. He is in very serious condition. The nursing home notified his doctor. His doctor took 5 days to call in a prescription and did not hospitalize him or see him. When I found out about this, I had him hospitalized and am changing his doctor.

If I become scarce or do not answer all e-mails addressed to me, this is why.

He is doing a bit better now and things may be OK, but if things worsen and this will be the reason that I may be not as responsive for a short while.

Retune any time you change your transmit frequency more than +/- 50 kHz from the frequency that you last tuned on.

Hello,
I am new the the world of tubes. I understand the tune up procedure
and have that down on my TS-820S. My question is if I tune up in one
part of the band and change freq. in the same band, how far can I go
before I should check everything and be sure it is adjusted correctly
for the new freq? Had a solid state rig that went bad and with all
the holiday costs, didn't have much extra cash to get another solid
state rig. At first I thought it was going to be a pain, but I have
to admit, it is kinda fun to have dials to mess with.

I found that my TS-520SE is fairly "broad minded" on 20 meters. It tends to have the same tune settings across the entire band. However, given that each of these old radios has a distinct personality, yours may need tuning every 50 KHz or so.

To shorten my tune up time I obtained a sprial bound book of blank note/recipe cards. I set up one page per band with the range of frequencies I'll be using and then noted the load, plate and driver settings for each frequency. I also noted the antenna tuner settings for each frequency. Now when I change freqs or bands I just dial in the noted setting and I'm ready to go. For quality control purposes I will double check these settings every six months or so, just to guard against something drifting out of spec as the radio ages. For example after replacing the 10 meter crystals I noted that the plate setting on 20 meters drifted up a couple of ticks.

Now if I can just remember that calling CQ into a dummy load is not a radio malfunction.....

Walt, thanks for the reply. Things have improved here but I'll run through the earlier measurements as well as your latest suggestions just to make sure I'm on the right track.

I did realize that TIF at the rf board was too low so I checked D44 on the if board and found it OK. I pulled the if board, looked it over closely and checked continuity of the cabling between rf and if boards.

After re-seating the if board and all the connectors I found that I now have drive and can tune into a dummy load (40 and 20m tested so far) with close to 100w out. Looks like an intermittent or dirty connector at the if board might be the cause of the no drive/output problem. I'll dig some more and let you know what I find.

The 12by7 is good and the r13/r14 divider is still OK. I'm using a Metex DMM (10M ohm input impedance) for the DC measurements (except for the final plates where the panel meter was used).

I can flip the scope to measure DC but it has a 100V input limit. The vrms measurements I reported last time were done with the scope on AC.

Again, thanks for the help. I may need more.

Topic: 11439 Message: 11648

In the '50s I was a Regional Service Manager for one of GB's largest valve/tube manufacturers. There were an increasing amount of dual standard radio and television receivers. These were usually designed with a separate tuner for each band, AM/FM, Band 1 and Band 3. These were quite often sold in areas where FM and/or Band 3 were not available. When these services were finally installed it was discovered that the valves/tubes in the tuners had failed, little or no emission. The cause was cathode poisoning, due to the heaters being on without any HT supply, switching the HT between tuners was the usual way of changing standards. A modification was issued by most set manufacturers, on our advice, to install a resistor of 250K to 500K across the HT switches. This allowed a low current to pass through the valve/tube, thus keeping the cathode 'turned over'. In later valve/tube manuals issued by the manufacturers, this was one of the protocols. On that basis, I would not recommend that the heater switch is left on for long periods, unless you are transmitting.

Re:- To switch off or not, there are at least three points of view,

a. When Independent Television opened up in 1955 all our equipment was valved, pulse generators occupied a full height 19" rack, and there were at least two. These were switched on in the morning and switched off at Close Down. Valve failures were fairly frequent and caused quite a lot of inconvenience. Research by the industry showed that leaving the equipment on permanently reduced valve failure to a very low order. The trouble was that the insurance companies would not agree to this unless the areas were supervised at all time. Finally, they agreed and the equipment remained switched on. All faults dropped to a very low order. As most of the circuitry was pulse with most valves being either on or off, mainly twin triodes in Binary Counters, valve failures very almost none existent.

b. A variation of the opening paragraph, in other words don't leave any valved equipment on without at least a minimum 'trickle' of HT. I don't think that the domestic insurers in GB would take kindly to you leaving Ham gear on un-attended, in the event of a fire they would almost be sure to refuse a claim. I would suspect the equipment manufacturers would not be willing to claim that their equipment was designed to be left on permanently. Even the best 'gear' is built to a price, and certainly would not meet professional or military standards.

c. The environment, Great Britain is facing an energy crisis, almost 50% of our energy is 'bought in', the costs are rising all the time. The availability is under threat. Despite sitting on around four hundred years supply of coal we have closed most of our mines, and buy

our coal overseas. So, we are under constant pressure to reduce our consumption. It is frequently pointed out that all the television sets left on stand by use the output of a large power station. The computers which are not switched off at the wall socket use a considerable amount of energy. The same goes for many similar appliances, we are surrounded by energy wasting devices. Most Western countries import at least 40% of their energy requirements, mainly from unstable sources. So if your rig, computer, microwave, television/s, and all those little black boxes are left on, you are contributing to the problem.

It makes you think, don't it!!

Subject: Re: [TS-520_820_530_830] TS-820 Magicom

Is this the manual for the Magicom he is wanting $16.00 for ? I think I can come up with one for $ 15.95.

Just joking, if I can find it I will make a copy and send it to you for free. It is a one or two page manual.
This is a device that makes the RF processor in the TS-820 a RF limiter. It is not all that bad. It was made by W6TOG and uses an FM limiter chip as the RF clipper. The number is rubbed off of the limiter chip and I have not been able to identify it.

Gordon was kind enough to send me one that I reverse engineered except for identifying the chip. I believe that the chip is the same at a TA7060P except that the TA7060P is an inline package and the chip in the Magicom is a round metal one.

As I remember. C-133 was removed to disable the gain reduction circuit in the original compressor and C-139 was removed. I believe that R-105 and R-110 may have also been removed. I believe that the input and output of the Magicom went to either side of where C-139 was. I believe there was a connection to the side of where C-133 was that goes to D-39 and 40. This makes the comp meter work. There is also either a 9 or 14 volt connection and the board is grounded where it solders to the back of the IF board.

To remove it, remove the Magicom board and all of the wires. Replace C-133 with a 22 pf ceramic disc capacitor. Replace C-139 with a .01 uf ceramic disk capacitor. Replace R- 105 and 110 with a 10 K 1/4 watt resistor each.

It works pretty good. Should it have a problem, it will only affect operation with the processor on.

This information is from memory and I am 57 years olde, so I cannot guarantee the accuracy of it.

BTW, if anybody knows the number of this chip i would find it interesting. I bet it was a common FM IF limiter in the day.

Don't worry Walt, your dad is much more important this group. I'll keep my fingers crossed for your dad's health. Pneumonia is a nasty thing. When I was diagnosed with asthma 3 1/2 years ago, it was discovered I also had pneumonia. It's not something to be taken lightly, as I know first hand. I almost ended up in the hospital from it.

73 & take care,
Ellen - AF9J

11652. Five questions

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-21 19:45:52 UTC
From: Bill Barron
Topic: 11652 Message: 11652

Perhaps these have been addressed before, but unable to find
threads in search:

1) FIX light: When first starting up the 520SE and setting the
function in VFO; both the VFO and FIX light illuminate. This
Doesn't 'seem' to effect the rig -- and fix light will eventually
go off after an hour -- but what's the problem? The lamp does not
illuminate in the 'VFO.R' position.

2) 10 meters: In dummy load tune-up, rig works fine (ok; 50watts with
weak 6146's) for 80, 20 meters-- but seems dead at 10 meters.
Is this common? Problem? How to fix?

3) Idiot: Ok. I have a low pass filter. Do I hook this up before
the tuner, after the tuner, or after the amp or not at all?
My amp is an old
LA-1000 sweep tube with (yes) very weak tubes-- max out maybe
is 200 watts; which is ok given attic dipoles.

4) S meter: The S meter maximum deflection on receive seems to
be s-7 -- even though signals received may be 20 over (per my
newer Yaesu rigs). Audio receive quality very good-- just the
meter seems to be way, way off. Can I fix it? How?

5) External VFO. I have a 520 and a 520SE external VFOs. Will either
work? Also have interconnect cable-- but it doesn't seem to work.
Is there a special setting on the rig I need to set? If the cable is
bad-- is it a staight pin-to-pin connection? If so, I'll re-wire it.

Thanks for any help and suggestions. Really like these old hybrid
rigs. Am playing with a matched set of 599 Twins also. Awaiting the
R&O publication to take upgrade tests -- so it's time to get the
ham shack fully-operational.

73,
Bill W1WAB

11653. RE: [TS-520_820_530_830] Five questions

From: BRENT BAUM
Topic: 11652 Message: 11653

Bill,
I can only address item 5, my 520SE also seems to have problems 2 & 4.

The VFO-520 and VFO-520S (there isn't an SE version) are virtually identical. The S version has a dark back plate behind the dial to match the S/SE transceiver's dark back plate. I believe that the S version also has an additional band on the band switch.

The cable is a straight 1-to-1 connection, no crossovers. Use your ohmmeter to check continuity of each pin end-to-end. Check how tightly the connectors fit into the sockets. My 520SE has a loose spot inside the VFO socket and if I bump the radio just right I drop the connection. (So don't bump the radio.)

As far as the 10m question, I need to tweak the oscillator, etc. coils to bring it on line. The procedure is in the owner's manual in Section 6.

Regarding the S meter, I hope someone has good advice. The owner's manual says to use a radio frequency signal generator to inject a 50 micro-volt signal on 14.175 and then adjust a trimmer pot for an S-9 reading. However, I don't have a sig gen.

Have fun,
K7MEI, Brent

Brought the 520 over to a friend's house to test the output on a Bird
Wattmeter into a dummyload. Full output!!
After bringing it home I do not get the 60ma of plate idle current.

Checked all connections and switch positions. Anyone have any ideas?

From: baumbrent
Topic: 11655 Message: 11656

Here is what Clif told me when I had a brain freeze regarding plate idle current:

The bias is set in the SSB Mode while the radio is in TX and mike gain all the way down, counterclockwise.

The meter switch does nothing in RX mode it only indicates TX readings and only when it TX.

The reading you are getting in Rx is the AGC, not ALC, big difference.

Set the bias on 20m to 60ma IN SSB TX MODE using the bias pot on the side. It should be the same on all bands.

Clif

Hope it helps.

I believe that the lowpass filter should be installed on the
transmitter output or the amplifier output but not on the tuner
output. Make sure that the filter is rated to handle the amp output.

Low Pass Filter would go before the antenna tuner but why use it unless
you know you're having a TVI problem.
Rig puts out approx 100 watts; your amp 200 watts; what's the point; no
one will know except your electric company.
Replace weak 6146's and probably weak 12BY7. Report back if 10 meters
still not functioning.

With the latest two (Nov and Dec) FCC actions, both R&O's have been
issued.

Pete, wa2cwa

11662. Re: Five questions

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-22 03:14:44 UTC
From: w5rkl
Topic: 11652 Message: 11662

If you use the amplifier, place the filter between the amplifier and the tuner. I agree with Pete, if you do not have TVI problems then you don't need to install the filter. Use it as a door stop.

Turn the FUNCTION switch to 25Khz position and tune the main tuning dial to a 25Khz mark on the dial. Peaking the DRIVE control for maximum S meter reading. Does the S meter read higher than S7? More than likely the 520SE needs an alignment.

With the VFO-520 attached to the 520SE, the VFO-520 FUNCTION switch determines which VFO is used. Leave the 520SE FUNCTION switch in VFO postion.

The following is how the remote VFO works with the 520SE (with the VFO-520 plugged into the rear 9 pin socket).

The remote VFO-520 FUNCTION switch in REC position:
Remote VFO-520 controls the receiver frequency and the 520SE VFO control the transmitter frequency.

The remote VFO-520 FUNCTION switch in REC/XMIT position:
The remote VFO-520 controls both transmit and receive frequencies for the 520SE. Main 520SE internal VFO is disabled.

The remote VFO-520 FUNCTION switch in XMIT position:
The remote VFO-520 controls transmit frequency. The main 520SE VFO controls receive frequency.

The remote VFO-520 in OFF position:
The main 520SE internal VFO controls both transmit and receive, remote VFO-520 is disabled.

The VFO-520 RIT control:
With the remote VFO-520 RIT push button pressed, the remote VFO-520 RIT control varies the receive plus/minus the receive frequency.

If the remote VFO-520 does not appear to be working but the LEDs lite up, remove the cover and clean the switch contacts, relay socket and the relay contacts. I had a similiar problem with my remote VFO-820, it would not work split. Cleaning the switch, relay socket and relay contacts fixed the problem.

The cable between the remote VFO-520 and the 520SE is a 9 pin straight through, pin for pin, cable. As Pete said, check each pin for continuity using an ohm meter. If one wire is broken on either end, the remote VFO-520 will not work; especially if it's the power lead.

Why the FIXED light is lite for the first hour of operation, that's more than likely a dirty contact on the fixed channel oscillator board or a capacitor that needs replacing. Try cleaning the plugs on the fixed channel board with DeoXit.

The only time the FIXED light should light up is with the FUNCTION switch in either VFO-R, FIX-R or FIX position.

With the function switch in VFO-R:
The 520SE's internal VFO controls receive and, if installed, one of the selected fixed crystals controls transmit.

With the FUNCTION switch in FIX-R:
The 520SE's internal VFO controls the transmit and, if installed, the selected fixed crystal(s) controls receive.

With the FUNCTION switch in FIX:
If installed, one of the selected crystals controls transmit and receive.

The crystal selector knob is located on the LOAD control. There are 4 positions. Crystals must be installed before any of the fixed FUNCTION position will work. The crystals are options, not included with the TS-520SE from the factory. The FIX channel crystal board is located directly behind the 520SE internal VFO.

Power output should be approximately 100 watts on 160 through 15 and about 80 watts on 10. The output power depends on properly alignment, good 12BY7 driver and good 6146 finals.

I seem to recall the 520 series suffered from a relay problem on receive. It's been 25 years since I've owned a 520 so possibly someone else can provide more information.

73's
Mike
W5RKL

With only an S7 meter reading on receive, did you adjust the pre

After reading more in the manual, I found that, sure enough it was
off. Now that I can put the station back together I may just have to
take a picture and post it to the group.

Finally got my home brew VFO cable built and retrieved my D104 mic from someone I loaned it to. A quick re-wire to make it work and viola. The VFO works, the DG 5 works and the AT-200 works with a long wire attached.

It's fun having to twist knobs to make things work instead of just a couple of buttons (other HF radios are a TS-50/AT-50 for mobile and a TS570D/G).

I guess to really make it right a MC-50 would be the appropriate microphone, but I'm really not a desk mike fan. What would be an appropriate hand mike for a 520SE be?

Also, I don't really hear much of a difference when the wide switch is on. I'm going to do a bit more reading in the manual to see if it is something I should worry about.

Not sure how this mic rates as far as audio, but I think that the
520SE came with the MC-30S hand mic. I got one from my 520SE and it
works fine.

If you want a hand mike, the Heil HC-5 works very well with the 520 in a hand mike. It actually works better in a hand mike than it does in a desk mike.

I like the D-104. Go to n9wb.org for an article on the D-104 and a modification that gives it a smoother sound. No I am not selling anything, this tells you how to do this. It also includes other D-104 information.

Glasd to see your reading about that Kevin. It's been going around and pretty much all of us are observing it. You'll learn something over the next 11 years and obtain some good QSO's too.

I've heard reports from one say it'll be this and another say it won't be much. Of course the two of you will have a good radio to enjoy some good contacts. I had some suprises over the last couple of cycles with mine.

Thank You Brian, But I just got my HC-10 clock. I've been using the instructions to teach me how to set the clock and access the time zones. It's nice to have and compliments the station well.

What I was offering was if someone needs instructions I'd get them the info. Next, I must build a shelf to place it on. I'm going to set it up on the solar panel and cells system to avoid power failure.

I thank you for the offer, but I must recover from the holidays financially before I move on to the furthering of the station.

Allen, an MC-50 was the mic accessory that sold with the 520, but also of that vintage era was not uncommon to see other mics like D-104 used. Hams adapted and was acccepted adaption. It may be cheap or maybe it was just what was available. A shure 444 mic was another. All were good options and worked well.

Originally the MC-35S was the handmike of high impedance that Kenwood sold as the accessory for the these radios. If you watch ebay you'll see them selling occasionally. I've watched two in the last couple of months.

Peter has a good point. 100 watts or 200 watts will not sound any different to the other station in most cases.

Peter A Markavage <pmarkavage@...> wrote: Low Pass Filter would go before the antenna tuner but why use it unless
you know you're having a TVI problem.
Rig puts out approx 100 watts; your amp 200 watts; what's the point; no one will know except your electric company.
Replace weak 6146's and probably weak 12BY7. Report back if 10 meters still not functioning.

With the latest two (Nov and Dec) FCC actions, both R&O's have been issued.

11678. Re: [TS-520_820_530_830] Five questions

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-23 01:18:45 UTC
From: John Harp
Topic: 11652 Message: 11678

Question #1 I would get to worried over. If it works don't fix it. I have one light out on my VFO right now. I need to replace one LED and that hopefully should be the resolution to that problem, but it still works otherwise.

Question#2 Your tube finals may be going. But while your in there check visually for other things and clean the bandswitches. Your radio may be suffeering from some stressed parts. Remember the grand ole lady has been around and some TLC may keep her going. Proper tuning is important. Check the high voltage too. 800 or 900 volts. Make sure of your 60 milliamps and if your finding it a little difficult to drive then that's a sign of the driver going bad too. You may see a variance in output on different bands like maybe less than 100 on 10 and more than 100 something on 80, but outputs like 50 are questionable. Check the tubes for the type too. 6146B's are what you want. You could try the neutralization process and see if it helps also.

Question#3 are you having a problem with RFI or TVI. Many times a good ground is the culprit. The shorter your run to ground the less likely the problem. For example: my ground is 3 inch copper strap (low impedance) and it's length to the 8 foot ground rod is 6 foot. That's total length. By keeping your ground length below 1/4 or less it really keeps the interference down. Mine is good for me with my Amps to 10 meters. It's .039 wave at 7 mhz. The only thing mine bothers is two touch lamps in the house.
My filters are one set between the 830 and the amplifier and the other between the amplifier and the antenna tuner. I have both the common mode and harmonic types. It does hurt the incomming signal a little and makes a small loss out, but that's offset by the half inch hardline I use to the antenna. I planned out about .27dB on 40 meters with 115 feet for length between station and antenna.

Sweep tubes I've been told can have harmonic radiation problems. I've never had one, but I was told use filters and ground well.

As for the S-meter, that is only a relative indication. You'll know what a signal is by listening to the conversation. Your reports will tell the other operator an idea of what they sound like and vice versa. You'd be suprised what moving your station from one place to another can do. That's why I moved mine to an out building, free of flouresent lights and dimmers and other noises common to a house. Keeps the noise down with the family too, as well as RFI and TVI. Planning makes a big difference.

Some will say you need a filter and others will say you don't. I'd say if there's a problem check your ground first. Then apply your filters as needed. Keep your station well grounded.

There's in a nutshell what I learned over 30 years that may help you. I once knew someone who had a sweep tube amplifier and he had a problem in 5 houses with diploes outside. You may find verticals more prone to the problem because of following the path of man made noise. A dipole up higher and away from the building can solve that somewhat so long as the shield isn't radiating on the transmission lines. Some have said baluns or sleeve chokes help. A few turns of coax 6 inches around they say can keep radiation down. Others say it's

a waste of time. I say use as little power as needed and good SWR's help alot along with good grounds. All that will go a long ways.

By the way I use vertical mostly but also have end fed horizontal. Planning is going to mean alot to you now. You have a good rig, give it a good antenna and feed line and by all means make sure you have a good ground.

Bill Barron <wabarron@...> wrote:
Perhaps these have been addressed before, but unable to find
threads in search:

1) FIX light: When first starting up the 520SE and setting the
function in VFO; both the VFO and FIX light illuminate. This
Doesn't 'seem' to effect the rig -- and fix light will eventually
go off after an hour -- but what's the problem? The lamp does not
illuminate in the 'VFO.R' position.

2) 10 meters: In dummy load tune-up, rig works fine (ok; 50watts with
weak 6146's) for 80, 20 meters-- but seems dead at 10 meters.
Is this common? Problem? How to fix?

3) Idiot: Ok. I have a low pass filter. Do I hook this up before
the tuner, after the tuner, or after the amp or not at all?
My amp is an old
LA-1000 sweep tube with (yes) very weak tubes-- max out maybe
is 200 watts; which is ok given attic dipoles.

4) S meter: The S meter maximum deflection on receive seems to
be s-7 -- even though signals received may be 20 over (per my
newer Yaesu rigs). Audio receive quality very good-- just the
meter seems to be way, way off. Can I fix it? How?

5) External VFO. I have a 520 and a 520SE external VFOs. Will either
work? Also have interconnect cable-- but it doesn't seem to work.
Is there a special setting on the rig I need to set? If the cable is
bad-- is it a staight pin-to-pin connection? If so, I'll re-wire it.

Thanks for any help and suggestions. Really like these old hybrid
rigs. Am playing with a matched set of 599 Twins also. Awaiting the
R&O publication to take upgrade tests -- so it's time to get the
ham shack fully-operational.

73,
Bill W1WAB

Yes Chris, I found that out the hard way too. Whats worse is the literature mentions nothing of this pronounced effect. I went for years and replaced tubes over and over again and it only happened to me recently. I can imagine how you felt. I was frustrated. I had to go calm down for a while and come back to look at the radio.

Boy did I feel dumb afterwards. But I learned something and it was easily fixed. This happened before I found the group. So don't fell bad. It happens moreso than you think.

I watch a number of places. I'll write back if I see one.

Meanwhile, go to ebay and set up in your favorate searches, a search for HC-10. When one shows up there, it'll tell you in an email. These usually have several days to get a bid in.

I just got mine that way. I went up against two others. The one backed off the other went on a bid war with me and I paid a high price for mine despite it's in mint condition. Hope you do better.

Topic: 11439 Message: 11681

I turn mine off and even tho it's got lightning protection on it I disconnect form the mains anyway. This helps isolate it to the out boulding away from the house. I also disconnect the vertical from the feedline as well as set the antenna switch in an unused position or the dummy load. If I'm not around there's no sense in the radios running. It just runs up my electric bill and leaves the risk of lightning wreaking havoc not to mention a fire risk. The frequency drift isn't worth those issues.

11683. Re: [TS-520_820_530_830] How often to tune?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-23 02:23:04 UTC
From: John Harp
Topic: 11633 Message: 11683

Yes Doug it's not as big a deal as everryone makes it to be. Tuning on different frequencies can be done quickly and easily once you know how. Just tune to a dummyload first and that sets you for the antenna pretty much. Takes seconds. Remember, if you can tune the reception for loudest audio in, thats the one you've already got somewhat tuned. Next tune up at low power and you're most of the way there with out stressing the parts inside. you might even fell close enough. You can tweak it a little after that, but you may not gain much more. Once tuned, I can switch to my linear and reduce the ALC to reduce the drive. 65 in gives me full legal limit and to drive it hard is bad for both the transiever and the amplifier not to mention the unwanted spurious energy above and below the frequency I was trying to use.

Now some of what may affect your bandwidth and settings may be coming from the antenna or whatever the tuned circuit is in front of your rig. I use a rather broadband antenna that allows me to sit in portions of band without tuning much, but the load line is 1/2 inch hardline feeding a good vertical. The SWR at the band edges is about 3 to 1. A dipole could be a different story.

A small change in frequency may not be a big deal and reduced power may spread that a little further. But don't stress your components if you can help it. Some parts could be a little difficult for you to replace not to mention the time your down and the expense.

If I see little change in the output between two frequencies close together I don't sweat it to much as long as I'm not driving to hard or on air to long. But I don't push the rig to much to often either.

Now tubes may be a little more forgiving than solid state, I used to push 6146's to 3 to1 on dipoles years back, but since got out of that. I have a versa V tuner that untes pretty much anything I could load.

But take care of that ole radio right and it'll take you a long time. If in doubt, until you know by feel tune it anyway-properly. It only takes a short time and unless your in a contest or some fast paced environment what would it matter.

Doug <dsib432@...> wrote:
Hello,
I am new the the world of tubes. I understand the tune up procedure
and have that down on my TS-820S. My question is if I tune up in one
part of the band and change freq. in the same band, how far can I go
before I should check everything and be sure it is adjusted correctly
for the new freq? Had a solid state rig that went bad and with all
the holiday costs, didn't have much extra cash to get another solid
state rig. At first I thought it was going to be a pain, but I have
to admit, it is kinda fun to have dials to mess with.

Court,

I attached a schematic for wiring a MD-1 to a Kenwood 4 pin rig like the TS-830S. I also attached a schematic of the MD-1. Since the reflector will strip the attachments I also Cc'd you so you should get my message direct with the attachments. You didn't specify which MD-1 you have (MD-1B8 or MD-1C8) but the wiring is the same.

Let me know if you have any problem receiving the attachments or if you have additional questions.

Date: 2006-12-23 15:24:57 UTC
From: Bill Barron
Topic: 11652 Message: 11689

Dear John~~

Thanks for all your very useful comments.

I had moved the rig from inside the house to a new 'shack'
in the garage (see photo on QRZ), which has improved reception and
is closer to my antennas. I have baluns and coil 'chokes' on all
the antennas.

They are the real 'issue' --I know -- as I must use
attic dipoles; outdoor antennas being forbidden. Attic height
--or actually lack thereof -- also precludes verticals. No
metal gutters either. Flagpole antennas mixed results locally.

Hence the lack of any real power being applied to the rig/signal.

I have two dipoles (20 & 80-- the latter wrapped round and round the
beams)and two big Cushcraft 70/2/6 mtr beams in locked due west
position. These antennas do a pretty good job -- I got 91 6 mtr
contacts last season -- some cross-county--using very low RF power.

Yes, RFI is an issue as all the house and cheap TV cable wiring also
runs thru the attic. The grounding also a 'problem'. I have a
good copper bus and good copper ribbon grounding all 14 of my rigs--
but to date I've had to hook this to nearby house ground at main
breaker box. I plan to run an old shorted coax outside (10 feet)
to ground stake soon; but with sandy dry Florida soil, this may not
be a better solution. For this reason, most local hams use
excellent club station for DX.

Thanks again for your suggestions. We'll be working on it.

73,
Bill W1WAB

wrote:
>
> Question #1 I would get to worried over. If it works don't fix it.
I have one light out on my VFO right now. I need to replace one LED
and that hopefully should be the resolution to that problem, but it
still works otherwise.

11690. Re: Turn off or not turn off? Lightning

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-23 15:55:28 UTC
From: Clif
Topic: 11439 Message: 11690

As far as turn off or not your choice. If you are disconnecting
everything to protect from lighting don't forget the ground wire. I
can't count the number of radios I have repaired for lightning damage
that the ONLY thing hooked up was the ground. No antenna, no computer,
no AC mains, nothing but a ground wire.

Don't ask for an explanation, there is none where lightning is concerned.

Clif

Topic: 11652 Message: 11698

Alright Bill, But you may find a little trouble above 21 mhz with the ground length that long on HF. Can you put High pass filtering at the Cables for TV to help? Between the Low Pass from the transciever cutting the frequency to below about 30 mhz (and ground it good) and the High Pass (ground it good also) you may have enough isolation.

Also look into the common mode filters. Some times a break in resonance may do the trick. I have the RF Inquiry commonmode filters and they made a difference for me. I used to run an end fed quarterwave 160 that would bite you good on a node by mic or key. Wouldn't want to try a pchooked up then. Feedback galore in the shack especially with the amplifier on. that's why I went to a good ground. I found my station was actually floating above ground and that solved alot of it for the end fed. When I went to the flagpole I bought from Force 12 it did good to 20 or 30 meters. But 40 was not so good 80 and 160 I raised a wire to the top for resonance out to a tree. It worked but not so good.

Now I built a 33 foot vertical that lifts out of the ground and has a hinge action at the base. It fits the CC&R rules and it's painted flat black. It vanishes to the backdrop of trees behind it. You could make a flagpole and make it removable. Use radials under it. even if you hide them just under the ground. Bury the coaxial feedline to it.

I got touchy neighbors and that's how I got around it. Put it up after dark and remove it before light again.

It's a bit noisy because it's a vertical but the way I constructed it makes it really get out the signal and even at full power nobody knows in the neighborhood. Even within our house the only thing that is affected is the touch lamps. But that's even barefoot. It's the voltage regulation of the rig online that triigers them. even the clip on RFI chokes cant' seem to shake that. It's just the voltage change on line. RF is decoupled.

That's one of the reasons I went to the shed. The other is the electrical noise in the house. It's unbelievable what going to the shed did for me. Now I begin the process of building solar power into the station for weaning off the power grid a little at a time. VHF is already on the 12 volts solar panels and batteries with my HC-10 clock and lighting to go next.

Heating is my biggest concern right now and this is less draw I need for the operation. But insulating as I go and building the outlay with the walls is slow and messy. But when it's done, it'll be very nice. A weak signal down in the noise comes out very well. For right now I pick up the mic and talk and put it back down since it's cold metal chills your hands. But it's better than it was. Been growing over the years, better and better.

One day I hope to share it. I hope yours will get better also. I've run 830 for 30 years now. It's done me well and it's a little more immune to interference than many radios. I just did what I could to make sure it stays that way.

You may try the flagpole and add a wire on top at night so nobody knows. Run it to a tree but try not to run it toward something that it may interfere with, for that is the way the radiated signal may follow.

One more thing, check into the archives about using the ALC control that james added. It uses the 9 volt battery and a 220K ohm pot to reduce power by reducing the ALC. That may help too. It's done thru the Auxillary Jack on the back of your radio. When you get better tubes this may help you by not driving your Amplifier so hard. A really good ground is very important then. Especially with sweep tubes I hear. I have an FL-2100B and an SB-220 clone. The FL-2100B runs 2 x 572B's and the other has 4-400A's I will soon upgrade to 3-500z's when I can make a better power supply.

With Amps like these we have good ground is very important. Imagine your RFI problem barefoot. Now Imagine how much worse it gets when it passes thru the amplifier. If its a mess at 65 watts for example and your going to say 1,000 watts, you've just made it 15 times worse. So good transmission lines and good ground factor in as very important.

Use flat stock for your runs since it's lower inductance and keep your length absolutely short as you can. Don't tie to the house electrical ground. It'll radiate right back to the rest of the house and everything in it. It may act as a noise antenna to your neighbors too.

A ground for the elctric box is polluted as far as your concerned. Your radio will show you the difference just listening to it. Others may hear it too. Especially on a vertical. Verticals are known to oick up noises from other nearby resonant objects and carry the noise too.

S ostay stealth and stay isolated and decoupled.You and everybody else will be better off for it.

Any questions you know a place to run it. Oh and use a long ground rod. You may need more than one. Iv've not tried a loop on the ground yet but I hear it works and I've used a counterpoise wire in an apartment once when keeping lower power. It helps a bit when there's no ground available but watch that very high voltage on it,its a real hazard; the results can really be shocking. Even lethal.

When I found my station above ground it was in the thousands of volts.

If you apply what I told you you most likely will save yourself alot of grief. Maybe a life too.

See you on the air. 73's.

Dear John~~

Thanks for all your very useful comments.

I had moved the rig from inside the house to a new 'shack'
in the garage (see photo on QRZ), which has improved reception and
is closer to my antennas. I have baluns and coil 'chokes' on all
the antennas.

They are the real 'issue' --I know -- as I must use
attic dipoles; outdoor antennas being forbidden. Attic height
--or actually lack thereof -- also precludes verticals. No
metal gutters either. Flagpole antennas mixed results locally.

Hence the lack of any real power being applied to the rig/signal.

I have two dipoles (20 & 80-- the latter wrapped round and round the beams)and two big Cushcraft 70/2/6 mtr beams in locked due west position. These antennas do a pretty good job -- I got 91 6 mtr contacts last season -- some cross-county--using very low RF power.

Yes, RFI is an issue as all the house and cheap TV cable wiring also runs thru the attic. The grounding also a 'problem'. I have a good copper bus and good copper ribbon grounding all 14 of my rigs-- but to date I've had to hook this to nearby house ground at main breaker box. I plan to run an old shorted coax outside (10 feet) to ground stake soon; but with sandy dry Florida soil, this may not be a better solution. For this reason, most local hams use excellent club station for DX.

Thanks again for your suggestions. We'll be working on it.

73,
Bill W1WAB

Yes your right about that cliff. I isolate everything I can. Anything with in 4 foot of it is definitely in danger when a stroke makes it's path. It's usually not stopped by a lightning surge protector either.

I've seen holes blown thru a wall where a wire was that you could crawl thru. And I'm not talkin small and tight either, I'm big too.

That's why I don't like the rig turned on and left on. It's just useless to you and an accident waiting to happen.

An electromagnetic pulse is another similar dangerous event also.

Clif <clif@...> wrote:
As far as turn off or not your choice. If you are disconnecting
everything to protect from lighting don't forget the ground wire. I
can't count the number of radios I have repaired for lightning damage
that the ONLY thing hooked up was the ground. No antenna, no computer,
no AC mains, nothing but a ground wire.

Don't ask for an explanation, there is none where lightning is concerned.

Looking for the cover for the controls on the side panel of a 520s, if anyone has a junker or one excess to their needs, that I could buy. Seems like a lot of these go astray. This rig was complete and original, still had the Matashita tubes, but no cover. Maybe Kenwood should have shipped 'em with a little silver chain like on your bathub plug. Anyhow would like to wish all on the group and their families all the best wishes for the season and coming New Year.Hope this does not offend anyone. Dennis.....VE6AC

On the topic of disconnecting the ground connection to all the
equipment, what are some methods of doing this quickly?
I thought of using SPDT knife switch between the main ground panel,
and ground buss at the station desk. What are others doing in this
regard?

Happly Holidays to all,

Hi Bob,
Well, The No transmit turned out to be some Bad solder joints on
the Bottom of the RF board. I touched the 1.5 mhz coil for the driver
section with my probe and the thing came to life. So I removed the
board , flipped it over and went to work with Magnifier headset and my
trusty soldering iron. After I reinstalled the RF board, I removed the
IF board and did the same thing to it. The Radio is working very well
now. I have worked into Antartica and The Faukland Islands and Costa
Rica on 20 SSB barefoot. The fellow I purchased the radio from told me
that it had been to several others before me, yet no one was able to
make it work. I guess I was just more fortunate in locating the trouble.

No, It looks as if the wire coming out of one end of the resistor just broke off. Perhaps due to age and vibration. The fellow I bought it from told me that it had not transmitted for years but that the RX was working fine. He said he had it packed away in a closet. He took a lightning strike at his house that took out some gear and his computer. Later on, he removed the 830 from the Closet , plugged it in and there was NO RX or TX. He told me that several others tried to fix it but no one was able to get it to RX or TX so he sold it to me as a Parts radio. I found it more fun to fix it rather then parts it out. I'm pleased that I did because it works really nice now that I have repaired and aligned it. As a bonus it has a full set of Filters and came with a VFO-230 and cable.

From: Gordon
Topic: 11711 Message: 11711

Has anyone swapped their 6146B tubes out for the 6883B 12 volt version ?

I was thinking of trying this mod on the 830 I have here. It puts out
about 100 watts with the 6146B's that are it it now, But it might be
fun to try the 6883B mod. It looks pretty simple, Just wewire the Heaters.

73,
Gordon

I am getting ready to sell a VFO-230 that I recently Acquired.It works great but has some scratches on the case where it rubbed other gear. I started checking around and looks like these things sell for Big Bucks ! The last two that were on Ebay went for $385.00 each plus shipping. So, I have to ask, What makes these VFO's so valuable ?

Thats amazing Gordon, I paid $200 CDN for mine. I have considered selling my 830 line but the freight to ship it anywhere would be too much. I have the 830, SP230, VFO230 and AT230.

I think what it says is that for some reason when an item is up for bid on EPAY(no not a typing error) the shark fight starts and people think they are "winning" something. I've watched current commercial items being sold used on EPAY and selling for more than a new item. Who was it that said " there is a fool born every minute". Mr. P.T. would have a field day on EPAY if he were alive today.

Please Drop This Topic Here

Again, I appreciate the thoughts and prayers regarding my father.

Unfortunately this has led to a religious debate that is off topic for this forum. Both sides of this issue have been well represented and it is time for us to get back on the topic of Kenwood Hybrids.

So please drop this topic here. And lets all remain Amateur Radio friends.

I don't see any gain here. Got to rewire the filaments, most likely re-neutralize, and the net result is what you had before. Now, if in the future you blow out one of the 6883's, and have no spares, then you have go find one or rewire the filaments back to 6 volts, install the 6146's and re-neutralize again. Sell the 6883's on ebay and then buy yourself a present.

From: John Harp
Topic: 11720 Message: 11730

Well I did mine for less than that from ebay, but for less than that. If you do your homework and bid carefully that is avioded with those since they come on ebay more frequently. Some pieces are less often seen. Like the HC-10 clock in mint condition.

You may have to bid higher for that. But VFO-230 is frequent enough you can bid and if it goes to high bid the next and so on. Mine was a repair that didn't pay the bill and the item was sold to foot the bill. It needed only one LED replaced and operated as is. They even sent the LED to do it yourself.

I forget the price now but think it was about 235 dollars.

Not a low price I grant you, but like I said learn do the homework watch what the items are going for and what the bids are flowing like and soon you'll have the gist of how the flow goes and how to get the items without more greater expense.

I find it beats going around the hamfests at the distances I must travel to take all that ime to find the bargains. That's how it used to be before the places on the web came to be. Now instead of shooting most of a weekend into hamfest you can pick and choose when you want to persue the item you want from home.

Yes you may get burnt but who really wants a bad mark on them on ebay. It comes back to haunt you later. Never bid on something you can't really afford to loose on.

You may not like the idea of buying from some stranger that you don't know of our group, but many times we're getting the gear from family of silent keys that may otherwise wind up disposed of or butchered. So we do a good thing here this way too. We get it into the group possibly with this move eventually instead of a landfill or some ocean dumping.

Presonally, I've not been burned yet on ebay. Sometimes just by asking I get an interesting story to go with the item.

But a strategy to purchasing goes a long way. Watch other sources as well and soon enough you'll have what your looking for. All resources have thier plusses and thier minuses. If you need it now and don't mind the the cash for the opportunity then ebay is good. If the bargain is top priority because you want to sell for some profit then it may well not be the better alternative. Although I have seller status I don't sell gear on ebay. It just is bought for my station and used till it can't be used anymore.

Well Gordon you bring up a god point. Some of it is because somebody knows they can get that at certain times of the year like before christmas. They know what the potential is of that item when someone wants it bad enough or if you rarely see it. The condition of an item has alot to do with it too.

Other times an auction is from a silent key and the departed family knows little about the item. Often sold as is, you must base your purchase and bid upon that given information at that time, considering the resource. The condition of the item many times won't have as much to do with it as much since the seller in this case won't know as much about the item.

To summerize the answer, it depends upon the scenarios of item by item.

That is what I found to be the answer to that very same question which I early on asked myself. This is what I've found to be the more obvious answer to be.

Well Gordon, like you I have considered that mod also. I like you I can mod and mod again without it bothering me. I havew chosen to put it off for right now since I have to many irons in the fire at the moment.

I would think after rewire and neutralization the radio should work fine. Any difference in power should be realized by a change in filament power I would think. I suppose it would be nice to have the idea tried and the results archived for the futrure.

I have begun the process of converting my station to solar by steps. Thus considering the possibility of trying 12 volts for solar as well as portable and maybe the mod for as I say archival to the future.

Gordon <n6wk@...> wrote:
Has anyone swapped their 6146B tubes out for the 6883B 12 volt version ?

I was thinking of trying this mod on the 830 I have here. It puts out
about 100 watts with the 6146B's that are it it now, But it might be
fun to try the 6883B mod. It looks pretty simple, Just wewire the Heaters.

That sounds like one I would enjoy the challenge of if I had the troubleshooting gear and the time like I used to. Good to hear that one. Thanks.

Gordon <n6wk@...> wrote: No, It looks as if the wire coming out of one end of the resistor just
broke off. Perhaps due to age and vibration. The fellow I bought it
from told me that it had not transmitted for years but that the RX was
working fine. He said he had it packed away in a closet. He took a
lightning strike at his house that took out some gear and his
computer. Later on, he removed the 830 from the Closet , plugged it in
and there was NO RX or TX. He told me that several others tried to fix
it but no one was able to get it to RX or TX so he sold it to me as a
Parts radio. I found it more fun to fix it rather then parts it out.
I'm pleased that I did because it works really nice now that I have
repaired and aligned it. As a bonus it has a full set of Filters and
came with a VFO-230 and cable.

Topic: 11439 Message: 11734

Well that is one way to do that but you want to turn off the other wire as well so there is no power anywhere in the circuits.

But just as importantly you want to remove all station grounding. you know that goes to the ground lugs on the rear. They are separate grounding from the wal power grounding.

In concept, no enegy in circuits and isolation are your best bets. But also remember that a direct hit is a direct hit. Nothing avoids damage of a direct hit. You can how ever reduce the likeliness of static charge and nearby strokes.

taephono <taephono@...> wrote:
On the topic of disconnecting the ground connection to all the
equipment, what are some methods of doing this quickly?
I thought of using SPDT knife switch between the main ground panel,
and ground buss at the station desk. What are others doing in this
regard?

I have bought 6883B valves on the grounds that this should work but I have not yet had reason to install the valves.

The story going round is that there is a huge supply of 6883B valves in the USA so they should be cheap to obtain as 6146B substitutes. However, the 6883B valves that have appeared on eBay in the last three months have been offered at similar prices to the 6146B so in these circumstances I would rather use the 6146B.

In the last month I have seen a USA eBay seller offering a case of GE 6146W JAN (datestamped 1987) at $24.95/pair. I have never used the W variant but I would have thought its not worth considering 6883B at this moment in time.

I have bought 6883B valves on the grounds that this should work but I have not yet had reason to install the valves.

The story going round is that there is a huge supply of 6883B valves in the USA so they should be cheap to obtain as 6146B substitutes. However, the 6883B valves that have appeared on eBay in the last three months have been offered at similar prices to the 6146B so in these circumstances I would rather use the 6146B.

In the last month I have seen a USA eBay seller offering a case of GE 6146W JAN (datestamped 1987) at $24.95/pair. I have never used the W variant but I would have thought its not worth considering 6883B at this moment in time.

11738. AT-200 Service Manual...

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-25 18:30:47 UTC
From: Jeffrey P. Nast
Topic: 11738 Message: 11738

Hello everyone,

A couple months ago my AT-200 started acting up when trying to tune up on 160m. Previous to that 160m worked fine. All other bands tune in well.

Since I actually had a couple minutes to do something last night, I tried tuning in another similar antenna with the same results. So I figured the problem is in the AT-200.

After I pulled the covers off, the first thing I noticed was some black soot on the ceramic insulator that holds L4 to the phenolic board. Because smoke rises, I looked below L4. The insulation for the red wire coming from VC2 to the Band rotary switch position #1 (front) was charred near the rotary switch!

Upon closer inspection, the Band rotary switch has two wafers, what I'll call front (closest to the knobs) and back (closest to the connectors). When operating the Band rotary switch, I noticed that the back wafer was fine, but the front wafer had a quite a bit of slop to it. When the switch was in the 160m position, the front wafer switch was still contacting both positions 1 and 2, rather than just 1 only. I to a pointed instrument and moved the contact to the correct position and then the 160m tuned in fine.

I think that the charred insulation and the sloppy wafer switch are related. Any reason for the charred insulation? Lightning is my guess... Then the resulting heat affected the wafer switch.

So I have to replace/fix the front wafer on the Band rotary switch.
* Does anyone have an AT-200 Service Manual?
* If not, can someone tell me the part number for the "Band" rotary switch?
* East Coast does list a couple of rotary switches for the AT-200. One subs to the other. I'm hoping they are still in stock...
* If not, is there another source for rotary switches? Yes, I know... another AT-200. ;-)

Thank you for your assistance! I really enjoy this list and have learned multitudes of things from the group. Merry Christmas!

Pete,
the only Gain I was possibly thinking is that the 6883B tubes are
less expensive then the 6146WMP tubes that I currently use and the
S-2001's or the 6146B's tube are very hard to find. I think the Last
Pair of 6146/MP tubes that I bought from RF Parts was over $70 bucks
shipped. I see 6883B's NOS on ebay for way less then that all the time.
Plus I like tinkering with Radios. hi hi...

I might just give it a go. It should be just Cut a Trace, run two
wires. Neutralization takes about a minute when using a Scope to do
it. Otherise It sounds fairly simple, in theory.
If i do it, I will document each step and take good pictures to write
an Article on it. Need to pick up a couple of 6883B's first hi hi...

Good advice, John.

I always contact the seller and ask a couple of questions about the item. It's surprising how a few words can reveal a lot about the type of person you're dealing with. As you say, they may be selling for a silent key in the family and know nothing about the equipment, but be perfectly sincere. It's not fool-proof, but it all helps in making a sound decision.

This may or may not help - I went to http://bama.sbc.edu/kenwood-.htm

They have manuals inDjVu format [*] -including the AT200 - it requires
an installer - easily got for Windows - the IE version is a quickie.

[*] This seems to be a protected site- however using guest/guest as
user/password got me instant access.

Good Luck

Let there be no mistake that I am very grateful for the prayers for my
Father's recovery. God is a very important part of my life and I cannot
imagine what my life would be without God.

Each person is entitled to their own belief, disbelief, and life
philosophy.
And that includes those who make the choice not to believe. However, I do
not understand how a person expressing personal concern for another within
the realm of their personal beliefs could be an insult.

My Father is showing progress. My personal belief is that the prayers of
many have largely contributed to his progress.

I thank those who are praying for my Father. I ask for continued prayer.

Whatever your life philosophy, I wish you the best for the holidays. It is
my personal choice to celebrate the holidays as Christmas.

Yes and sometimes you may find out something about the story of the previous owner.

For example: my vfo came from a repairthat didn't pay. but the vfo I got was from a retired fire chief of Lima Ohio of many years. He passed on and the family left the equipment in the house where he formerly lived with no interest in it's financial returns for the effort. The new tenant saw the opportunity and made a dolar but knew not what she had.

As for my second 830, it was owned by a CW net op in New Jersey. The father got to a point where his health could no longer enjoy the radio, so the daughter sold the radio on ebay and I got high bid. I think 275 dollars was it's price.

That's why I say do the homework and if you have the time work the bids. It can take a while but if you can wait you'll likely have what you want.

There's something else to think of in the long run, The more bid war goes on the higher you pay and for each of those someone looks at what was paid and figures they can get that just like the last one did. So if you can bid and move on to the lower bid to win, transaction by transaction thus the price stays lower for other buyers in the future.

Ya know Gordon it may give us an alternative to units with bad transformers if this works. Thus we can wire to 12 volt supplies to operate the radio if we find a way around high voltage supplies. 520's had such accessory.

I believe it allows the antenna to be fed to another receiver. This is as opposed to allowing a separate receive antenna as one might think. See page 16 of your manual.

I have a couple of problems with RF Parts. Firstly, they don't like shipping outside the USA and secondly, they are very expensive.

As I said earlier, I bought GE 6146W JAN from thetubecenter on ebay and they currently have an auction 330065730914 for $24.99/pair plus $5.95 shipping. He charged me $10 to ship three pairs to the UK. I don't know if you can better that price with the 6883B currently.

I disagree.....looking at the Service Manual it allows the use of a separate antenna on receive.

In the normal position it uses the same antenna [the SO239] on Rx and Tx, switched across to 'ext' it uses the other socket on the Rx path [and also avoids two sets of relay contacts] - could be very handy if you have space for, say, a Beverage on 160 for Rx as well as a suitable vertical for Tx.

Bummer! A separate Receive Antenna jack would be very useful for bands like 160m, where separate receive antennas are very useful. It would elminate the hassle of having to use a relay/sequncer to switch antennas. I'm surpised that the TS-520SE has it and my TS-820 doesn't. But then again, my 820 is an earlier radio, and maybe they didnt' offer it until the 520S & 820S lines came out.

hi,

I've built my entire hf station from used gear on ebay
and I did not pay too much.

ts520, 530, ts50 and accessories including transverters.

If I find errors in the listings I email the seller to
tell them, helped many td570 owners get more for their
estate rigs (570 dg or t573S) by looking at the rear s/n stickers.

if they need manuals I point them to the websites.

Timing is also a big factor, just picked up a nice
ts-570S estate sale from the xyl at a great price.

I've also seen gear at the hamfests go for top dollar too !

Just like buying that used car or dream home, there is always
another one just like it !

I have a set of JAN 6146Ws in my TS-820. They're fine. They
neutralized very well for me, and I get about 110 to 130W out with
them.

11758. TS-830s on 12v with DS-2

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-26 23:16:31 UTC
From: Michael Bellis
Topic: 11758 Message: 11758

This is only my second post, although I have been watching diligently for about six weeks --- want to thank John Harp for his kind responce to my inquiry about transverters a couple of weeks ago and praise his refusal to get involved in the recent ruckus. Now to my question. I have an 830s that was bought in Singapore in 1981, it's had the mod to it's main transformer circuitry allowing it to operate on 120v. But I do see some reference to it's main transformer having DC windings unlike US models, thus perhaps allowing it to accept the dc to dc DS-2 power supply. Any knowledge about this would be appreciated and if it's true, anyone with a DS-2 for sale would be and instant friend! won't be able to respond until 12-30-06.

Hi Luke,

You do not have to have a VF0-520 for the TS-520 to work. There are a couple of pins on the VF0 connector jack on the back of the rig that have to be jumpered if you don't have a VF0-520. The purpose of the VFO-520 is to allow split operation - transmitting on one frequency while receiving on the other.

Hope this helps some. :)

From: Kelly Maiden
Topic: 1213 Message: 11762

VFO is an acronym for "variable frequency oscillator". On your 520, the
VFO allows you to vary the operating frequency continuously within the band.
For example: the phone portion of the 20 meter amateur band is from
14.225 to 14.350 Mhz. (for general class licensee's).
To tune in stations on this band, you switch the band switch to the 20
meter (14 Mhz.) position, and then the VFO allows you to
vary the operating frequency within the band. The 520, unless it has a
digital display added, has an analog VFO.
The owners manual will describe how to calibrate the dial to the marker
signal and then you have to read the markings to determine
your operating frequency. So, to answer part of your question, your 520
already has a built in VFO. The VFO 520 is an add on unit that
you can use to increase the flexibility of the transceiver. One reason
to do so is to operate "split" frequencies. Essentially, one of the
VFO's is used to control
the transmitter frequency, and the other the receive frequency. The 520
is a fine rig. You have to learn how to load and tune it, and how to
make sure your not operating out of your allowable frequencies.
If you need help, there are many here, myself included that will be
happy to guide you. You should also review the older posts, there are
tons of useful tips there.

From: Joan de vk5kyo
Topic: 11711 Message: 11763

Hi John and Gordon

Merry Christmas and a prosperous 2007 for all.
I hope to answer your question as I have done exactly that some time ago on a TS520S and TS830S. Output with the 12V RCA tubes were around 125-135 Watts.
But for those interested, I did post a question to the group back in February, which not one person responded to (See below for old posts). I thought from a technical perspective this should have created a good discussion, but alas. I'm not an engineer, and was rather interested in what the experts in this field may have to say about it.
I think that running parallel heaters makes more sense in maintaining the characteristics of individual tubes. ie. heater resistance from one valve will not affect the other tubes performance. A simple illustration of my thought, is to put a number of 12 of 1 Ohm power resistors in series and connect it to a 12V supply. Ohms law will tell you that 1 Amp will flow. But if one is to measure the voltage across each resistor, they will most likely be all different and the heat dissapated in each resistor will be different. This is the result of tolerance. Manufacturers can build anything with a tolerance factor. The tighter the tolerance the higher the cost.
By measuring the voltage across the standard tubes in my Kenwoods, I have proven that tolerance will play a part in the tubes performance. It can not pull its weight if the heater voltage is not enough, and the other tube will be more stressed because of higher voltage, hence higher emission. Any comments this time round?
Joan VK5KYO

Feb 2006
Hi everybody

I know there has been lots of discussions in the past regarding matched pairs of 6146's for the Kenwoods and alike, and the answer may have already been posted, but I have just repaired 2 TS-830's with output power problems which left me with some questions.
During the quest to resolve the issues, I was thinking a little more on the issue of matched valves.
The owner of the radio I was repairing, send me a matched pair of 6146's and on each of the valves was a number written on it.
Can I assume this is the gain of the tube, or is it the current drawn under certain test parameters, and the fact that both numbers are the same, I will say that they are a match?
The other question I was left pondering with is when I pulled my RCA test tubes out (which happens to have 12 volt filaments), and rewired the set back to standard 6 volt operation, will it be as good?
When the experts check new tubes for so called matched characteristics,

are they applying 6volts to each filament and testing the gain of a tube individually, or are they putting a pair of tubes with their heater filaments in series (as Kenwood is wired this way), and then checking for their individual gain.
The results will be different and for those that know, can you tell me if it is significant or not.
The reason why I say it will be different is because my experience has been that the filament of each 6146 is not exactly the same resistance(call it manufacturers tolerance), and if you measure the voltage drop across each tube, it maybe 6.0 volts for one and 6.4 volts for the other. That is pretty well what I measure.
This is a bad thing because the tube with a higher resitance will also have a higher voltage drop across the heater and will therefore be more stressed.
Which begs the question whether it will be working harder than it's mate who is having a holiday.
I know the valves will still work and more than likely put out 100++ Watts, but it does sort of blow the matched pair theory.
I'd would call them truly matched if both the filaments have equal resistance and therefore hopefully the same heat value generated to promote emissions and finally they have the same gain.
If the tubes were only tested individually with 6 volts applied to the heaters, then the only way we could correct the problem, is to balance out the weaker valve with a bit of extra resistance parallel with the heater so that both 6146's will have equal heater voltage.
I hope you get the drift of what I am trying to say.
I'd appreciate your thoughts on this.
One might say that it is too much theory and that in the practical sense it wont make a scrap of difference.
It may well be the reason why there have been some premature failures, especially when one starts to mix different brands of 6146's.
Illustration time - Different manufacturers of clothing are all asked to produce a size 16 garment, and yet the final product all seem to differ a little in size.
To stay on the humurous side, my last statistic count of 5, goes to the most popular name in this group, and that is"Bill". The Bill's have it.
Because of this fact, I like to drag these wonderful gentlemen into another illustration, and say that allthough they carry the same name, all Bills are not the same, in fact they are all unique.
So how can you ever have matched pairs of 6146's??
Joan VK5KYO

Another reply I posted in May 2006
Hi Chris

The answer to your question is, YES, most certainly. The heater supply is in fact 12 volts and the original wiring puts the 6146's heaters in series. Just remove the series link, provide a earth strap for the front tube and run a new wire to supply 12 volts to the most rear tube. About 1 hour job by the time you take covers of and the circuit board and work out what your doing.

I have done this with my TS-520 and also a TS-830. They work great.
Great value for money and probably a well kept secret.
One warning though, is to put a warning on the PA cover that the heaters
are set for 12Volts. You dont want to go back there many years laters
with a nice new pair of 6146's and watch the sun go up for a few
seconds, followed by a very quick sunset and tears. Remembering then is
too late.

Here is a little extract from Glen. (you can Goggle for this article)

The 6146 Family of Tubes - by Glen E. Zook, K9STH
The 12-volt equivalent of the 6146 is the 6883, the equivalent of the
6146A is the 6883A, and the 6146B is the 6883B. Now, there are the tubes
that were manufactured for FM commercial service. These series go as
follows: 6883, 6883A / 8032, 6883B / 8032A / 8552. Again most of these
are "cross branded" with all of the tube numbers that are equivalent.

Next time Chris, or anyone else for that matter, if you can't get hold
of 6146's, don't hesitate to use the alternative at a fraction of the cost.

Luke-

A VFO (variable frequency oscillator) tunes the unit to its transmit and/or receive frequency (it's connected to the big tuning dial on the front panel). An external VFO allows an operator to transmit on one frequency and receive on another...DX stations do this often to make pileups more manageable for them.

You do not need an external VFO (VFO-520) in order for your TS-520 to operate properly, however, you will need the "VFO jumper" plug installed on the rear panel in order for the unit to function properly without an external VFO connected. I have seen many TS-520's sold on eBay without the VFO jumper plug supplied (If this sounds confusing, refer to the owner's manual, which explains this in more detail).

You mentioned you are not currently licensed...Do you have an Elmer yet? If you don't know what an Elmer is, the answer is "no." An Elmer is an experienced Ham who will guide you down the proper path on matters concerning equipment, antenna installation, operating practices and courtesies, etc. If you can't find one, there are numerous resources online. Use them if needed.

Until you recieve your license, keep the stand-by switch in "REC," the htr switch "OFF," and the VOX switch in "MANual." That's triple protection against transmitting illegally.

It would seem to be a good point. If the tubes for some reason had slightly filament resistances, such as if they were not of the same brand or production run, it is possible that the filament voltages will not be balanced. Parallel 12 v filaments would eliminate this problem. wouldn't it be cool if we could find a huge source of 6883Bs somewhere ?

It may well be the reason why there have been some premature failures, especially when one starts to mix different brands of 6146's.
Illustration time - Different manufacturers of clothing are all asked to produce a size 16 garment, and yet the final product all seem to differ a little in size.
To stay on the humurous side, my last statistic count of 5, goes to the most popular name in this group, and that is"Bill". The Bill's have it.
Because of this fact, I like to drag these wonderful gentlemen into

another illustration, and say that allthough they carry the same name,
all Bills are not the same, in fact they are all unique.
So how can you ever have matched pairs of 6146's??
Joan VK5KYO

Another reply I posted in May 2006
Hi Chris

The answer to your question is, YES, most certainly. The heater supply
is in fact 12 volts and the original wiring puts the 6146's heaters in
series. Just remove the series link, provide a earth strap for the front
tube and run a new wire to supply 12 volts to the most rear tube. About
1 hour job by the time you take covers of and the circuit board and work
out what your doing.
I have done this with my TS-520 and also a TS-830. They work great.
Great value for money and probably a well kept secret.
One warning though, is to put a warning on the PA cover that the heaters
are set for 12Volts. You dont want to go back there many years laters
with a nice new pair of 6146's and watch the sun go up for a few
seconds, followed by a very quick sunset and tears. Remembering then is
too late.

Here is a little extract from Glen. (you can Goggle for this article)

The 6146 Family of Tubes - by Glen E. Zook, K9STH
The 12-volt equivalent of the 6146 is the 6883, the equivalent of the
6146A is the 6883A, and the 6146B is the 6883B. Now, there are the tubes
that were manufactured for FM commercial service. These series go as
follows: 6883, 6883A / 8032, 6883B / 8032A / 8552. Again most of these
are "cross branded" with all of the tube numbers that are equivalent.

Next time Chris, or anyone else for that matter, if you can't get hold
of 6146's, don't hesitate to use the alternative at a fraction of the cost.

Hi Dennis,

Mine are a set of Milspec JAN tubes that are made by ECG-Philips (in other words, Sylvania). Here's the URL for the description. They are the ones above the GE 6146Ws:

http://www.rfparts.com/6146w.html#w

11770. TS-520 SE Mode Switch and S Meter

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-27 17:12:32 UTC
From: baumbrent
Topic: 11770 Message: 11770

I discovered two new problems with my 520SE over the holiday break.

1. The S meter will only run up to S 2.5, even on a signal that is rattling the windows. I suppose it needs to be adjusted. Is there a way to do so without using a signal generator? (It's a 50 mile one way trip to the big city to find someone who has one.) I need to get the S meter working so I can bring the 10 meter section into oscillation and peak the rest of the bands.

2. The audio output drops to about half volume after warm up, or if the radio gets bumped. Sometimes I can cycle the Mode switch and bring it back for a while, but it soon drops out again. Something is probably loose and/or reacting thermally. Any ideas before I begin chasing electrons through the schematics?

By the way I had a quick QSO from Northern Utah with N5PYJ in Texas at about 1600 MST yesterday. He was running an 830S at about 85 watts. Arm chair copy through the QRN.

Thanks all, and happy new year.

HAMs,

+ Looking for a VOX Delay Control Knob, similier to VOX Gain, NB Level, and Comp Level Control Knobs.

- Would be willing to pay a rea$onable price for a Parts Radio.

+ How can I stabilize the 'Drifty' VFO? Sometimes Cool for DX, but annoying for Rag Chew.

- Looking to "Re-Commision" this rig by Feb. '07. Looks good into the Dummy Load. Want to check the allignments and get some spare glass for the finals. Serial 2060330

What about utilizing some of the automatic antenna tuners with a 520S?

I've been looking at the MFJ-993B Intellituner based on the experiences
of one of
our local hams who has fallen in love with it. He does a lot of
contesting and experiments
with a variety of modes...and I've been contemplating it as an addition
to the shack.

I'm a tech...but had passed the written for General in November and was
working on my
code when the FCC announcement came out. I have a 520S and have been
slowly getting it
ready to go live in Feb or later...in fact I spent Christmas Day digging
the tower footing and pouring
some concrete...

I've been working on this process for the past three months to keep the
xyl from
screaming over my dumping large amounts of cash all at once...so it's a
process and the tuner
is a "down-the-road" item...not something I was expecting to do right away.

The MFJ unit will probably work great for tuning your antenna system(s).
However, for internal tuning of the tubes one must manually twiddle the
knobs as previously discussed.

Autotuners are very nice - I use a MAC200 and an SG239 here. However,
what you have to remember is that the tuner only works on the aerial.

You use them to get some power into that bit of wet string, but the
rig itself still has to see a good 50 ohms - and they do not autotune
on the input circuit.
Consequently if you tune the rig up on say, 14.335, into a dummy load
and then swicth to the tuner, it will be quite happy. The rig is on
song and the tuner worries about the mismatch on the aerial.
Now swing down to 14.195 - the tuner will do it's stuff on the aerial
but the rig in truth needs 'touching up', and you could be running in
excess of 2:1 on the input without even knowing.

Both my 520 and 530 go well 'off song' if I tune up from 14.070/14.080
to say 14.195

I do know what an Elmer is but i live out in Northwest Oklahoma and do not know of any Ham Operators out here and the colsest club is in Enid, Oklahoma that I know of and that in 96 miles away. So anyone willing to give me a hand or offer advice is always useful here. And again that you all for all the help on understanding the VFO. I am sure there will be many more questions once I get going more. Thanks, Luke.

Selling my TS830S with matching VFO230, AT230 and SP230. Rig has 500 Hz CW filter and 3 Khz SSB filter installed. Full output with spare driver/final tubes included. Pictures in the photo section under my call. Excellent condition on everything. Sell complete station for $900. My interests have changed.

Max

Hi Joan,
Sorry If I missed your earlier Post. Perhaps I was not even a member
of this group at that time.
I also agree that the Different Heater characteristics would affect
each tube separately and therefore longivity of both tubes.
I have just placed a bid on some NOS 6883B's and as soon as I
(hopefully) win the auction, I am going to place them in the 830 I
have here, do the Mod, and see what I end up with.
I can only see benefits from my point of view and I will Mark the
Final Cage with a Notice that the rig has 6883B's installed instead of
6146B's. Looks pretty Simple to do. I'm excited to try it out!

From: Gordon
Topic: 11770 Message: 11780

I am suspecting either a Dirty Band switch or a poor connection on one of the boards. It also could be a dirty relay, but not too common of a problem. If it is the relay, it's best cleaned carefully with a business card or dollar bill soaked with De-Oxit that is placed and rubbed between the contacts. I would suggest buying some De-Oxit and spraying all the controls and Band switches.Work each control and switch through it's motion right after spraying. Be sure to do this with the rdio OFF !
I remove each connector (One at a Time), spray them, reconnect and then move on to the next connector. Usually about 90% of problems can be solved this way. I swear that NOTHING seems to work as good as De-Oxit 5 for cleaning controls, switches and contacts IMHO.

From: Kevin & Natalia
Topic: 11776 Message: 11782

Hi Rene,

Just had the same problem as you, regarding C22 and C24, the main filter caps for the HV line.
You will find it hard finding replacement caps of the size and value for these, however all is not lost.
In my case, I purchased 2x 100uF/450v, which were smaller in diameter then the originals. I made a perf-board to mount and solder the new caps, .01 cap, and bleed resistor (all new). This has worked out okay, but they are right on the upper limit for the voltage.

I have since found through RS Components, that they have a 150uF/500v, that is very close to the same size. And from this group, they have indicated that 150uF would be acceptable as a replacement.
Don't know if there is a local store in your location, but I am sure you can check it out. You can have a look at this web-page http://www.rsnewzealand.com/cgi-bin/bv/rswww/searchBrowseAction.do?D=150uf&Nr=AND%28avl%3anz%2csearchDiscon_nz%3aN%29&Ntk=I18NAll&Nty=1&Ntt=150uf&Dx=mode%20matchpartial&Ntx=mode%20matchpartial&N=0&name=SiteStandard&forwardingPage=line&R=3819425&callingPage=/jsp/search/search.jsp&BV_SessionID=@@@@0570762729.1167267143@@@@&BV_EngineID=cccdaddjjemmkmecefeceeldgkidhgm.0&cacheID=nznetscape

You might need to copy and paste if the link does not work. Else type in 150uf in the search box, and go down about 1/2 way down on the first (1st) page, look for Capacitor, aluminium electrolytic, long life, screw terminal, ALS30, 500Vdc, 150uF

Hope this helps?

Kevin, ZL1KFM.

Hi, 73 for all members. I need your help. Where could I find the main
electrolitic capacitors for the TS-830S; the part number is C22, C24
C90-0327-05, 100mF 500V. Thanks in advance for your help and Happy New
Year.

Hi Brent... To follow up on Gordon's comments. I have just recently gone through a troubleshooting process where I thought that my receiver had a bad S meter, and after a long course of testing, I found that the front end had suffered a mild overload. The radio was still quite useable, and to my ear was not weak on receive. It was not "deaf" but we eventually deterimined that it was "hard of hearing." The S meter action comes off of the AGC line, and with the weak receive a very hear-able signal does not trigger the AGC, so the evidence was the weak S meter response. I don't have a signal generator either, and so I was pretty severely handicapped, that is why it took me so long, and so many wrong turns, but I did eventually figure out all of my problems using my MFJ-259 antenna analyzer as a signal generator. It is drifty, there is no kind of calibration of the signal level, but it will put a signal into the front end. It would be a lot easier with a signal generator, and if I had to do it again I would probably just get hold of one.

The reason I bring all this up is that we can perhaps figure out a few things on your TS520 before having to send you to town. <smirk> Definitely start with cleaning contacts, as Gordon says that will solve a lot of problems. Then if that doesn't work lets talk about jury rigging a test to see if we can figure out something.

Joan

I'm not sure that it's that simple.

Certainly, with the heaters in series, equal resistances in series across 12V will dissipate equal power and create the same heating effect, so each tube will be doing equal work (other things being assumed the same). So when one heater has a lower resistance, that heater will be dissipating less power, creating less heat, and therefore the tubes will in theory be doing unequal amounts of work.

However, what happens when we put the heaters in parallel? Equal resistance heaters will again dissipate equal power, but if the heaters are different resistances, once again the power dissipated in each will be different, and the tubes will doing unequal work. Two 120 ohm heaters across 12V will dissipate 1.2 watts each. If one tube is 110 ohms and the other 130, their heaters will dissipate 1.3 and 1.1 watts (approx) respectively - the lower resistance heater will create more heat and that tube will work harder.

The only gain will be that a variation in one tube will not affect the other - current through the heaters will be independent of the other tube's heater resistance. But they will still be different.

Another point is that I think that you would find that the relationship between the power dissipated in the heater and its effect on anode current is extremely non-linear, and therefore there would need to be quite a large variation in heater resistance to create any noticeable effect on how hard each tube works.

Or have I missed something?

Regards
Geoff VK2HQA

11790. Using 12v solar power

I would be interested in seeing details of your solar conversion.
Last year I visited Southern Spain and there houses in the mountains
are powered entirely by solar generated electricity that charges
lead/acid batteries which is used to generate 230v using an inverter.

I note that the Yaesu FT-902DM and FT-101E and both come with a 12v
inverter attached to the back of the radio. It seems to be a simple
inverter circuit driving the built-in mains transformer.

Would these 6883B valves have originally been intended to run off a regulated 12v supply? My reason for asking is that a motor vehicle 12v supply can vary from 11.5v to 15v so is the heater designed to cope with this variation?

I have looked at the circuits for the FT-902 and FT-101Z and both also have a 12v heater supply so wire both heaters in series.

Hi Geoff

Good point there, and from this we can definetly draw one conclusion, that we are never to mix brand names, because even though the tubes are probably all built to certain specifications, the spread of characteristics is likely to increase if slightly different materials are used by different manufacturers.
I suspect that if there were a number of different manufacturers making the 12volt equivalent of the 6146 that mixing brands will probably have less of an affect at 12v than if you were to use a pair of 6volt versions by different manyfacturer.

Having said the above, your last point may just be the thing that nullifies this whole debate. I have also stated before that it may not make a scrap of difference, but as I am a person that likes to logically think things through, I think the benefit of one tube not affecting the other is worth considering and not to mention the availability and costs of the alternative.
Now for the knowledgable, I don't know who the first manufacturer was for the 6146's, but how did the other manufacturers obtain the specifications of the tube so they can manufacture their version?. I have my doubt that there was freedom in exchanging this sort of information back in those day's. Maybe by reverse engineering the product. Yes, you can reverse engineer almost anything, and some companies do, but how close will you get to the real product using this method?

My other question in my earlier post was about the numbers written on the boxes of matched 6146 tubes. Are these a gain figure, when the tubes are tested individually, and the gain recorded on the box, or did they truly made an attempt at matching the valves characteristics by placing matched heaters in series (as in the Kenwood radio) and then measuring their gain? I suspect not.
But does it all really matter? Probably not, but I would like to hear both sides of the argument.
Many radio's out there are still using the original valves, however the more I think about this, the more I like the idea of the 12v heaters because I think it is technically correct to do so and there is a much cheaper alternative out there which have been overlooked and sold for peanuts. The persons that stands to benefit from this, is you.
Am I the really the only person running the 12v version in my Kenwood thus far?

Barry,
Don't bemoan that you didn't get the SE. Kenwood should have labeled it the CE for Cheaper Edition as the SE doesn't have the transverter connections, the dual AC/DC power option and a few other little items. Congrats on finding a good deal.

Hi Yves
Not sure if I can correctly answer your question, but it is from my
understanding that the heaters are still wired to the transformer. They
are not directly connected to the battery. I'm not sure how much smarts
are in these old inverters but I suspect that if the DC/DC inverter is
doing its job, then the output hopefully will not vary much and
hopefully very similar to when it is powered of the mains supply.
Can someone who has the inverter option verify the voltage variation
against different rev's on the engine? Is the HV similar to when at home?
The otherthing to mention is that some tubes have very critical heater
voltages. Any over voltage will drastically reduce the life of the tube.
That's probably why some linears also have "TX lock out" timers on them
to stabilise the temperature of the valve.
By the way I am looking for a transformer for a FT901DM. For the time
being I have used a FT101 transformer, so it is a receive only set for
now. Can anyone help here? (Yes, I know this is not a Kenwood number)

Hi Yves and all,
Does the Kenwood inverter produce a 'modified sine wave' (square-ish wave) or near sine?
Maybe an owner could scope it and tell us?
I'm wondering 'how rough is enough', as input to our precious mains transformers.
Maybe just buy a 12V rig rather than bastardising a classic.
BTW Yves, what's your call?

I must confess also on getting good deals....

Few years ago at a local hamfest, this lady had 2 ts 830s setting on her selling table with a price tag of $450 for both....also stated on sign was " both not working"....but both were mint mint mint condx.

Hundreds of people looked at them , but passed on them also.....
At the end end of the hamfest day, I happened to be walking past her table to go to my truck.....she was packing everything up.
I politely asked her " what wud be ur lowest price on both of those units".....she said....give me a $150 for both, but I'm tellimg u that both are non working, but light up. I broke my arm reaching for my wallet.....paid her cash.....we were both happy. I picked up both units, one on each arm....heavy. She said " wait a minute"....this other stuff goes with it.....the sp230 speaker....shure444 desk mic , boxes/ instructions.....I was grin'n.

After a looooong ride home.....
First unit I opened up .....the speaker plug in wire was off.....worked like brand spank'n new , PLUS it had both cw filters in it. NO service needed!!!!

Second unit.....speaker wire unplugged also.....but HV was only 450 volts.....replaced 2 HV caps.....presto.....perfect.

Another story.....
Buddy of mine (non ham) calls me on the phone.....says to me he just went to a local flea market.....and there was a box of radio stuff there....and there was a " something " with a meter on it....said I should check it out....
Well I went to investagate.... Found a brand new HAM M rotor with controller box....all hardware , bolts etc in a unopened bag.
I asked the gentleman.....how much u want for this.....he said ....give me 75 cents.....get it outta here.
Again , another broken arm.....

Another story.....
A lawyer calls me up.....says he got tons of ham equipment in a house that was being sold.....seller said " ham stuff" must go ASAP.
Lawyer said he jotted down names of equipment...tons of COLLINS , HEATH KITS ....etc. Told me must be a gold mine of stuff there.....BUT , here is the catch.....U MUST REMOVE TODAY.....all for a $1000.....gulp.
I ended up with complete LATE COLLINS S LINE....also GOLD DUST TWINS.....AMPS....ANTENNAS.....I can go on and on.....unreal.....sold about 6 thousand dollars worth of it.....still got stuff.....unreal.

Sooo , it goes to show u , good deals will happen when u least expect them.....
NO.....I'm not a dealer.....just a lucky fella.
BOB N3OO

You said: "that we are never to mix brand names"

In my 40 plus years of hamming, I have not seen that to be an issue unless the tubes were used in some type of push-pull operation. I have mixed 6146/A/B/W's(pair of A's, pair of W's, etc.) made by RCA, GE, Tung-Sol, ECG, and others with great success.

You said: that mixing brands will probably have less of an affect at 12v than if you were to use a pair of 6volt versions by different manufacturer."

I'm not sure how you came to that conclusion.

You said: "I don't know who the first manufacturer was for the 6146's, but how did the other manufacturers obtain the specifications of the tube so they can manufacture their version?. I have my doubt that there was freedom in exchanging this sort of information back in those day's. Maybe by reverse engineering the product."

RCA first introduced the 6146 back in the mid 50's. Tube manufacturers had reciprocal agreements with each other and all were involved with licensing their tube products to other manufacturers.

You said: "about the numbers written on the boxes of matched 6146 tubes."

As far as I can remember 6146 tube manufacturers didn't "match", one-on-one tubes. They generally manufacturer in lot quantities and depending on the demand, each lot could be as high as 10,000 to 25,000 tubes. Depending on the manufacturer, numbers on box could be year/month/week of manufacture and/or a lot number.

Today's sold "matched tubes" could be nothing more then matching the color of the boxes or a simple tube checker check to measure transconductance to find tubes with readings that fall fairly close to each other and within some specific + or - variation. Marched tubes in circuits designed around the 6146 family and working in parallel are not necessary. However, from the sellers point of view, besides generating additional sale revenue, it conjures up a "feel-good" perspective to the buyer.

Hi Joan

I think the bottom line to this debate is that our radios were designed on the assumption that the tubes would be the same, and in general anything we can do to adhere to that design should be regarded as "good practice". This means, for me, preferring two tubes from the same manufacturers batch if possible and probably nothing more than that.

While there may be advantages to running parallel heaters (perhaps a ready supply of cheap, good tubes), I suspect that other benefits are more "feel good" than real. There may even be a negative, thinking about total heater current especially at switch-on when heater resistance is lower - will this be stressing the heater supply? i don't know, but it is something I would check before doing the mod.

As for manufacturers sharing information, you'll find that "back in those days", information was much more freely available than it is today. Remember consumer electronics with a complete circuit diagram and parts list on the inside of the cabinet! In the case of components, the design would probably have been licensed to other manufacturers at a price.

All the best
Geoff VK2HQA

By the way Joan, where are you - in Adelaide?

In 1964 RCA introduced a 'new' version of the 6146B/8298A which had the RCA "Dark Heater" which was designed to operate between 6.0 and 7.5 Volts and which will accommodate variations in battery voltage between 5 and 8 volts. These details are taken from the RSGB Bulletin June 1964.

As an ex-Service Manager of a major valve/tube manufacturer I can assure you that while valve/tubes from different manufacturers can appear to be the same, the difference is in the quality and type of materials used, especially in such items as the cathode and anode/plate. This is more likely in specialist valve/tubes.

In the average domestic items, unmarked batches were traded between manufacturers, as obviously it is less costly to do one massive run of a particular item and share it out, than try to cut each others throats. At one time in GB practically every lighting lamp was made in the same factory, and then tested, stamped, and packed by the individual manufacturer.

As far as matching is concerned, I would suggest that it is not a good idea to mix different manufacturers valves, which should preferably be from the same batch. Batches differ subtly in such matters as inter-electrode capacity, electrode spacing and the usual manufacturing tolerances. Sometimes there are slight design changes between batches.

I have several of the RCA data sheets for the various 6146 if anyone would like them.

Subject: Re: [TS-520_820_530_830] Re: 6146B / 6883B

Hi Geoff

Good point there, and from this we can definetly draw one conclusion, that we are never to mix brand names, because even though the tubes are
probably all built to certain specifications, the spread of characteristics is likely to increase if slightly different materials are used by different manufacturers.
I suspect that if there were a number of different manufacturers making

the 12volt equivalent of the 6146 that mixing brands will probably have
less of an affect at 12v than if you were to use a pair of 6volt versions by different manyfacturer.

Having said the above, your last point may just be the thing that nullifies this whole debate. I have also stated before that it may not make a scrap of difference, but as I am a person that likes to logically
think things through, I think the benefit of one tube not affecting the
other is worth considering and not to mention the availability and costs
of the alternative.
Now for the knowledgable, I don't know who the first manufacturer was for the 6146's, but how did the other manufacturers obtain the specifications of the tube so they can manufacture their version?. I have my doubt that there was freedom in exchanging this sort of information back in those day's. Maybe by reverse engineering the product.
Yes, you can reverse engineer almost anything, and some companies do, but how close will you get to the real product using this method?

My other question in my earlier post was about the numbers written on the boxes of matched 6146 tubes. Are these a gain figure, when the tubes
are tested individually, and the gain recorded on the box, or did they
truly made an attempt at matching the valves characteristics by placing
matched heaters in series (as in the Kenwood radio) and then measuring their gain? I suspect not.
But does it all really matter? Probably not, but I would like to hear both sides of the argument.
Many radio's out there are still using the original valves, however the
more I think about this, the more I like the idea of the 12v heaters because I think it is technically correct to do so and there is a much cheaper alternative out there which have been overlooked and sold for peanuts. The persons that stands to benefit from this, is you.
Am I the really the only person running the 12v version in my Kenwood thus far?

Making a long story shorter, I picked up 2 TS-820 S units and a new digital readout all for $90.00. One didn't work because the VFO jumper was not there. The other had been partially parted out. I restored it and it is the one I am now running. The one that worked went to an elderly ham friend of mine who had never had a decent radio in his life. Of course he loves it.

From: Kevin & Natalia
Topic: 11804 Message: 11804

Hi All,

Could someone please advise on the best way to hook-up my TS-830S for digital modes using my computer.
I have tried hooking it up, using MixW, with the speaker output, and the mic input, but this does not allow me to monitor the freq (as the audio is muted to the computer)

Is it possible to mod the radio to take another output out, and maybe also include a input, bypassing having to remove the mic each time.

I mainly use the radio for voice, but do like to check out digital modes as well.

Thanks

Kevin, ZL1KFM.

I know it is a long way Alan - but have you contacted Medway Aerials -
advert in radcom they state 'repairs to all amateur and vintage Rx/Tx'

Failing that - Castle Electronics for 'service and supply of spare
parts' - specifically Kenwood. - They are in Powys

I have not had dealingswith either,merely plucked the ads from radcom

Not having one [it is a 530 here] but doesn't the 830 have an
extension speaker socket on the back which you could use?

I use the front headphone socket to drive the PC/MixW and running
'silent' PSK/RTTY is wonderful - if you cannot see it - you cannot
work it. Who needs all that noise?

Kevin,

The TS-830 has a transmit monitor that can be used to listen to the transmitted signal. Just press the MONI button on the front panel directly to the right of the MIC/CAR control.

Regarding another input, you could build the simple phone patch input described in the TS-830 user manual. The circuit consists of two resistors, 10K and 100K, as well as a RCA jack, and is connected to the IF unit, X48-1290-00. This mod, unfortunately, does not disconnect the mic jack. You would still have to unplug the mic or provide some method for disconnecting the mic element when using the digital modes.

You could build a simple switching box.. It would have connectors for the desk/hand mic, an external speaker, such as the SP-230, a connector for the TS-830S' external speaker jack as well as connections to the PC audio in and out. A single multipole two position switch could select the mic and external speaker in one position and the digital interface in the other position. Using the MONI function of the '830 would permit you to hear the transmitted signal.

11809. Re: [TS-520_820_530_830] Using 12v solar power

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-29 00:33:09 UTC
From: John Harp
Topic: 11711 Message: 11809

Well Yves I decided to start out small and build from simple. It wil be a while before I am all solar power. My VHF FM is now converted and my cloks and some lighting will go next. Eventually when the scale goes larger I will add amy HF Gear and my VHF transverrters.

I decided to get a few small cells to start and bought them one at a time. I kept them charged by a bettery chearger monitoring the charges as I was in the room with them. Next I bought a solar regulator. Not very large, but enough to get me started. I connected the regulator to the batteries as a bank of 3. Now these are not big lead acid cells but something to begin with. I got a couple of higher output panels of 15 watts each to keep them charged with thru the regulator. That way the cells don't get over-charged. The radios on the batteries at the moment don't take that much power and more room to expand is available. The panels I hung on an outside wall facing evening sun and are more than enough at the moment. I ran the power leads thru the wall leaving a small drip loop and then sealed around the wires.

So far the project is going good. My mother likes the idea enough she'd like to make a similar setup for a string of LED lights along the porch.

We have solar lighting along the walk and around the flagpole and we are happy with those results. Now the solar projects begin to assist with the shed which also contains the radio station which is a help considering the amounts of power that can be consumed at times there.

My question right now is about inverters and have yet to look into the subject. The group is welcome to comment if so desired. I eventually want to run the 830 by solar power. An inverter is a considering factor since it simplies the HV factor for the finals and driver.

But that's where that one stands for the moment. The radio gear is kept a distance from the lead acid for the time being. So far the system holds up well, but not much has been added yet either way.

I would be interested in seeing details of your solar conversion.
Last year I visited Southern Spain and there houses in the mountains
are powered entirely by solar generated electricity that charges
lead/acid batteries which is used to generate 230v using an inverter.

I note that the Yaesu FT-902DM and FT-101E and both come with a 12v
inverter attached to the back of the radio. It seems to be a simple
inverter circuit driving the built-in mains transformer.

Dave I'm looking into that very question soon enough here. An 830 can draw upwards toward 300 watts during transmit. So the size of the inverter for the load is what I'm looking at next and obviously how many more batteries to add. I have 2 panels at the moment and 3 smaller batteries for my beginning bank. I ponder the possiblity of 3 more batteries and maybe 2 more panels and that may suffice. The inverter size is the question at the moment beyond the fact that finances just became tight for a little while.

Dave and Loraine <dave.crooks@...> wrote: Hi Yves and all,
Does the Kenwood inverter produce a 'modified sine wave' (square-ish wave) or near sine?
Maybe an owner could scope it and tell us?
I'm wondering 'how rough is enough', as input to our precious mains transformers.
Maybe just buy a 12V rig rather than bastardising a classic.
BTW Yves, what's your call?

You may want to load into a dummy load and than to the auto tuner. Usually the tuner needs to have a small sample of the new frequency first to set itself. So tune into the dummy load then switch back to the tuner but use low poer first to set the auto tuner before loading full power. I have an SG-239 and that's what I have to do. Can't stay on it real long but it does work. It gets down to 2:1 for swr. For tube finals thats close enough.

BRENT BAUM <brentbaum5323@...> wrote: The MFJ unit will probably work great for tuning your antenna system(s).
However, for internal tuning of the tubes one must manually twiddle the
knobs as previously discussed.

Well I wouldn't worry about the Remote VFO right now. That you can deal with later. Thr radio will work for you as is. It comes with one Variable frequency Oscillator (VFO) in the unit.

The oth VFO implied is the remote VFO. This is attached to your Kenwood radio vis a special cable to a jack on the back.

Now what this VFO does is this: it makes the operation what they call split transieve. This operation is used more in DX. The cable is a straight thru affair going pin to pin for the most part.

They are available occasionally on ebay. Check around some the stores on ebay and see if they may have or have access to one. But that is still a ways away to you for right now. Get your liscence first and maybe watch for that other stuff as time goes on.

Another Old Codger <clattering.ford@...> wrote:
The simple answer is No, but make sure you have the link plug in the
VFO socket, it's all in the manual.

I am new to ham radio and I am currently working on my FCC license but
I went ahead and got a TS-520 on ebay and I was wondering if it must
have the VFO-520 to go with it or will it work without it? What
exactly
does a VFO do anyway? Like I said I am still learning and any
infomation will help alot. Thanks, Luke.

Hello Alan,

When I received my TS-530 it needed alignment, I followed the alignment procedure in the operating manual, using the Cal signal, it made a vast improvement. When I received the Technical Manual the same procedure required a large amount of test equipment, which I thought was rather humorous.

Read the Operating Manual till you are word perfect, buy the few simple tools needed and do it your self. That's why you are an Amateur.

The TS series are not 'black boxes' that need the professionals!! and any way most of them are board changers, I know, I used to be one myself in my professional life.

Hi
Hope you are are all having a good holiday season,and may i wish you all a good new year.
Just got hold of a TS520se and hope to have it up and running soon.I think it just needs re-aligned,tried contacting a few radio shops here in the UK, but not had any luck yet yet in getting one to do the work. (they say it`s too old).

bye just now and best wishes to you all from Scotland.

Ok well thank you Michael. Currently I'm working toward a solar station that will someday drive my 830. I've considered using the 12 volt version of 6146's and maybe it's modification of the High Voltage to it's tubes. Now for some radios that the transformers were lost this may get them going again. Gordon has recently pondered the idea of a project using those tubes.

I've heard of other in the past taking the radio out in thier RV's and using an inverter from batteries. I've seen it done in tractor trailers too. So my question is what size inverter to drive about 300 watts and how quiet will it be?

Now I've heard of this DS-2 but not a thing more. This may be a hard to find item. There was an accessory available as I recall for the TS-520 to convert 12 volts to something the radio could run.

There's a wiring diagram in the archives as I recall that is for a 520 and some beefing up may make it suitable for operation of an 830 since I believe it may draw a little more than a 520. The 830 is rated at 295 watts while transmitting.

So there's some options I've seen so far. I had a 300/400 watt inverter in my freightliner once, but it didn't have enough gump to run the 830. I used to plug in along the parking lot along with my phone to make calls. The larger inverter would have meant I had to direct wire to the batteries. In my company that waas a definite no no. I've seen what happened when some one did that to his truck at the Atlanta terminal.

Kevin,

There are many ways around your problem. As far as the receive goes, buy a 1/8" stereo splitter and plug it into the external speaker jack on the 830. Run one cord to your computer mic input and the other to an external speaker. Will probably sound better anyway. Keep in mind the level going into the computer will be dependant on your AF GAIN setting. Trial and error will get it right. I have a fixed output audio tap on mine to feed the sound card. It is very easy to do.

For transmitting, pick up a RigBlaster. It allows you to keep the mic connected and the computer will automatically key the radio when you transmit with MixW and the mic will still work when you are on SSB. I use a RigBlaster Plus on my 830 and it works just great.

Topic: 11817 Message: 11817

Greetings all,

My TS830s has developed an interesting problem. Whenever I put the rig into CW and insert a key (or even an unterminated plug) I get constant cw sidetone - at about 25% of the volume of when I use the CW key on recieve. If I put the rig into transmit it does not cause any output power (but the sidetone goes up to the full volume). If I switch in the "Vox" it does trip the rig into transmit.

I have ensured with a multimeter that I have no problem with the plugs, leads or the key...

any idea's?

As I use the rig 99% for CW I would like to fix this asap!

Michael,
I fitted the transformer from a 520s (this transformer had the windings for the ds-2) to my 830s and built the inverter unit from the circuit in the 520s manual.
It all works good now.
Hope this helps

Hi Kevin. I have a very simple interface that use between my TS-530S and the ancient (P166Mhz) laptop that I use for digital modes and logging. I use 2 audio transformers (1 in each line) for isolation. Basically 1 line goes from the headphone jack of the radio (through an audio transformer) to the line in on the laptop. The other goes from the headphone output of the laptop (through an audio transformer) to the mik jack on the TS-530S. I have disabled all Windows sounds(i use Windoes 98SE on this ancient laptop) and use VOX to key the radio when I transmit. Most people use 1:1 audio transformers, but I used 20:1 transformers as I had some in the junk box. I think you could use the 8 ohm to 500 (or 1000) ohm transformers, especially if you are using the mic input on both the radio and the computer.

I do not mind changing the mic plugs on the rig. You could build a switchbox simply enough though. I wouldn't bother with comercial interfaces as most of them are extremely overpriced.

The way to have a good signal on the air is to make sure that you have a clean signal from the computer, and then make sure that you have NO ALC action when transmitting. I find that this is easily acomplished on my TS-530S when running 20-30 watts output. This is all you should need to run, and I would recommend not going over 40 watts or so. This is for the same reason that you keep tune-up times to a mimimum...The radio is not meant to transmit at 100 watts (CW carrier) for any length of time.

Welcome to the wonderful world of amateur radio! Overpriced maybe, but they do work. I have built many homebrew interfaces and some worked fine, others were a pain in the butt. The RigBlaster has worked from day 1 and solved all my ground loop issues and I get compliments on the cleanliness of my PSK signal.

I assume that you are using a mono plug and not a stereo plug. In the Key plug are contacts that act as switches. My guess is that something in there is forming a resistive path to ground or another contact. Also, C-5 a .01 capacitor probably a ceramic disk type may be leaking to ground. This is on the plug and connects from a 220 ohm resistor to ground, Try disconnecting one end of C-5 and see if the low tone that you get on receive stops.Try cleaning the plug thoroughly with de-oxit. Be sure the plug is dry before assessing the result.

On the 520 and 820, when the inverter board is fitted, the multi-way power plug is wired to feed the heaters of the driver and PA from the battery, via the HTR switch. If you were running and 830 or a 530 from an inverter it would be advisable to wire the heaters direct to the battery, via the HTR switch. Trying to power the whole rig from an inverter would be an unnecessary load, and would also be inefficient due to the losses in the inverter.

As the 830/530 has a similar mains transformer as the 820/520, with a split primary, it should be possible to use the same inverter circuit, thus avoiding many of the losses of a separate inverter. Of course your 830/530 would never be quite the same. A good idea as long as you are happy with a dedicated vehicle rig.

Many of the 'narrow boats' used on British canals use a separate 240 volt 50 HZ alternator driven from the engine. Or a separate alternator charging a massive storage battery, or batteries, and a very big inverter, several Kilowatts.

hi,

as posted earlier, you should try the ext speaker jack
and connect to the pc sound card input.

when using the digital modes your pc and speakers will
give you the audio.

when you're done with digital then you just unplug the
ext speaker connection and your ready for cw ssb.
This is an original Plug and Play !

I have built and used the rascal (original) and it worked fine,
and also have the Signalink sl1+ from tigertronics.

the kenwood phone patch pc-1 or pc-1a have also been used to
interface the radio to the pc.

be sure to use the ALC 'mod' that is in the files section to
reduce your power out instead of the mic gain control.
The 'mod' in an external one and helps keep your signal clean.

During the 1950's the manufacturers were working hard with new coatings for the cathode in an attempt to lower the required temperature. There was/is the cold cathode tube which were usually gas filled and used ionisation to heat the cathode. The only ones that I ever saw were rectifiers usually in car radios. The synchronised vibrator became more popular, and of course the 'tranny' eliminated them entirely.

Blimey, that brings back memories of barreters and line cords!

Ron.

And any very responsible Radio Amateur would not be using SSB [the pattern of which is very plain on the waterfall] or even CW [just as visible] on the Digimode frequencies.

However I accept your point [up to a point <smile>]

Hi Guys,

Walt has one reason for wanting to hear the freq, the other, is that I like to be able to listen to the sweep, to get on freq. instead of watching a screen, which I would use also. I would prefer to have a line out that has a fixed level, this way, once I have found the digital signal, and decoding correctly, I could then turn the AF gain (volume) down, and not have to listen to the digital noise.

I will also look at someway that I can feed the input directly into the radio, either by a home-built rigblaster, or switch.

To all, thanks for your input, it has helped, and today I will be in the radio doing some mods, and improvements.

BTW, To Ken Winterling, sorry to say that I searched my TS-830S user manual, but I could not find any reference to the phone patch mod. If your copy has it, could I please request a scan, and send it to me directly. Thanks. sparc_nzr@... (home e-mail, gmail is for general)

I would like to wish everyone a Happy New Year, may 2007 be a great one, personally, and radio wise.

Regards and Thanks to all.

Kevin, ZL1KFM.

The latest edition of ARRL's QST has a project article from a guy that built a small audio box to take CW from his 'puter's audio jack into his radio's input. Looks like parts would cost about 10 bucks or so...and there were only about 8 of them. As I recall, he did this 'cause he had an older machine and didn't want to use the USB port but wanted to come out of the headphone jack on his machine into his radio's mike-input. He also made reference to a small freeware program you could download to generate the audio...and when I went to the website with it, there was a companion CW reading program that you could purchase for a minimal amount that would allow you to take the audio from your radio into the mike jack on the computer and have it scroll on your screen.

Looked to me a bit like a very poor man's version of RibBlaster/Rascal, etc....and didn't require using the USB port or a fancy radio input jack.

Kevin,

I extracted the TS-830S phone patch mod info and sent it as a JPG attachment. I included your personal e-mail address as a Cc on this message since the reflector will strip the attachment.

If anybody else needs the attachment just let me know.

Nice TS-820S. Looks good and works good with one
issue.
The rear dial (0-500) does not turn. Have been told
this can be fixed but not mechanically inclined to do
that.

The Digital readout is okay as well as the front
analog dial and all other function switches, etc.
Would like $300 for it plus UPS shipping from
Charlotte, NC 28227. Would prefer Local pickup, but
have original shipping cartons with inner box and
would ship that way.

Also Has the Frequency Calibration cable, extension
feet for the front and a new spare ant. relay that I
will throw in. I'm at (704) 545-9368 if you have
questions.
Thanks for looking,
Bill, N4DH

11835. removing tubes

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-30 01:12:09 UTC
From: redlegger2
Topic: 11835 Message: 11835

Hello all,

I need to help, Im cleaning up my new (used) TS-830. I was checking it over and noticed that the cap that goes from the top of the final choke to an coil is broke. My question is once I replace this cap how do i remove the final tube with out breaking the cap again. It looks like the cap was broke by trying to remove the finals.

Josh,
I remove and reinstall them all the time. The wire that connects to
the tubes is soft and subtle allowing for removal and some bending
without problem. In fact, I have NEVER broken one yet.

73,
Gordon

Topic: 11838 Message: 11838

Thanks for the responce on this subject from John Harp, Ron(G8URU) and Kevin(VK4AKU).
Unfortunately, I am more confused than ever. My Kenwood instruction manual (in English) that came with the Singapore purchased radio, cleary speaks of using the 830s directly from an 13.8 vdc source when fitted with the optional DS-2 dc to dc converter, no mention of inverters or any other apparatus, just the DS-2 fitted directly to the back of the radio via the 'blind plate' located on the back of the radio. Also has a diagram of a vehicle with the 830s mounted inside detailing properly sized wiring connections to the battery.
I am surprised that this is the first anyone has apparently heard of the DS-2, or directly using 12 vdc to power the 830s. Hope someone can give me futher info. or conversely perhaps I should scan the pages from the Kenwood manual and post them.
73,
Michael

Another source for the caps is Digikey. The 150/500 are $5.96 in
onesies, or with a few friends $5.05 in 10's or a lot of friends $3.63
in 50's. Buy 200 and they're down to $2.73. The PN is P7452-ND.

Or if you want the 100uf/500 they start at $4.66 and go down... P7449-ND

Sorry for the confusion Michael, the DS-2 may be a harder to find unit for your radio. It was desdigned originally for the TS-520 and 820 model radios.

I never persued it since I operate TS-830.

I fellit easier to just get an inverter for myself and attach to my battery bank which is loaded by solar panels.

Now Gordon is looking at the possibility of 12 volt substiution tubes for the finals used in these Kenwood tube hybrids as a possible project.

You may have stumbled upon a good new topic for the group. I'm still involved in the transverter project at the moment so I got enough going for me right now.

12 volt alternative for these radios is something I've desired to look at for some years now. I just have not got that far yet, notice I say yet.

The Kenwood DS-2 unit may take a while to find. I'd like tosuggest a favorate searches set up on ebay. That way it will send to your mailbox when one appears on listings.

Down in the groups archives I remember there is a dc-converter you can build to run something like that. You may want to check it out.

If you have a cap stuck on the tube top and need to remove the cap without breaking the metal dome from the tube, Soak it with WD-40, Liquid wrench, or something similar. (no WD-40 posts please) and work it loose. After removal, clean the WD-40 off everything that you are going to reuse with alcohol. Be careful, the alcohol will remove the markings from the tube as will the solvent.

If the metal dome should break from the tube, talk to me before discarding it if you think it is otherwise good. We often can save these.

Topic: 11838 Message: 11844

I've compared the mains txformer on the TS-820 and the TS-530, the secret in the 13.8V operation of the 520/820 is that there is an extra centre tapped winding on the 520/820 which is connected to the connection board which is used with the DS-1A DC/DC converter. The multiway power plug is used to adapt the internal wiring for DC operation, part of which connects the heaters to the battery via the HTR switch. DS-1A is obviously an inverter board. To operate the 530/830 on 13.8V, the best way would be to feed the heaters direct from the battery and power the rest via a 12V to 110/230V inverter, 150 to 200watt should be OK.

any auto Parts store should have them. I use AGC-6 fuses.They are
readily available.
They are Fast blow as Walt suggested to use.

Josh, if there is a parasitic choke on a tube, watch you don't break it. If you see a way to unscrew the other end form a mount I would do so. This relieves the stress on the part.

Recently I found a solder joint was broken and that the parasitic choke was dangling like a hinge at the joint. I still haven't figured out how it kept working like that.

n9wb <n9wb@...> wrote:
If you have a cap stuck on the tube top and need to remove the cap without breaking the metal dome from the tube, Soak it with WD-40, Liquid wrench, or something similar. (no WD-40 posts please) and work it loose. After removal, clean the WD-40 off everything that you are going to reuse with alcohol. Be careful, the alcohol will remove the markings from the tube as will the solvent.

If the metal dome should break from the tube, talk to me before discarding it if you think it is otherwise good. We often can save these.

Steve, I just use a standard 6 amp fuse from radio shack on my 830. Just don't use slow blow fuses.

If you blew a fuse find out why the fuse blew. It may save you more problems down the road.

Steve <sbhanson@...> wrote:

Did you use the phone patch for connection to PC? That would be a nice way to go.

james27613 <james27613@...> wrote: hi,

as posted earlier, you should try the ext speaker jack
and connect to the pc sound card input.

when using the digital modes your pc and speakers will
give you the audio.

when you're done with digital then you just unplug the
ext speaker connection and your ready for cw ssb.
This is an original Plug and Play !

I have built and used the rascal (original) and it worked fine,
and also have the Signalink sl1+ from tigertronics.

the kenwood phone patch pc-1 or pc-1a have also been used to
interface the radio to the pc.

be sure to use the ALC 'mod' that is in the files section to
reduce your power out instead of the mic gain control.
The 'mod' in an external one and helps keep your signal clean.

I thank you for this info Ron. This is handy Aand something I was gonna ask around.

Just for the sake of knowing, why would the filaments be wired separately? Efficiency and all that. Is there an alternator noise problem? I like what you brought to light here. I just needed to know the details if you wouldn't mind.

Another Old Codger <clattering.ford@...> wrote:
On the 520 and 820, when the inverter board is fitted, the multi-way power plug is wired to feed the heaters of the driver and PA from the battery, via the HTR switch. If you were running and 830 or a 530 from an inverter it would be advisable to wire the heaters direct to the battery, via the HTR switch. Trying to power the whole rig from an inverter would be an unnecessary load, and would also be inefficient due to the losses in the inverter.

As the 830/530 has a similar mains transformer as the 820/520, with a split primary, it should be possible to use the same inverter circuit, thus avoiding many of the losses of a separate inverter. Of course your 830/530 would never be quite the same. A good idea as long as you are happy with a dedicated vehicle rig.

Many of the 'narrow boats' used on British canals use a separate 240 volt 50 HZ alternator driven from the engine. Or a separate alternator charging a massive storage battery, or batteries, and a very big inverter, several Kilowatts.

Subject: Re: [TS-520_820_530_830] TS-830s on 12v with DS-2

Ok well thank you Michael. Currently I'm working toward a solar station that will someday drive my 830. I've considered using the 12 volt version of 6146's and maybe it's modification of the High Voltage to it's tubes. Now for some radios that the transformers were lost this may get them going again. Gordon has recently pondered the idea of a project using those tubes.

I've heard of other in the past taking the radio out in thier RV's and using an inverter from batteries. I've seen it done in tractor trailers too. So my question is what size inverter to drive about 300 watts and how quiet will it be?

Now I've heard of this DS-2 but not a thing more. This may be a hard to find item. There was an accessory available as I recall for the TS-520 to convert 12 volts to something the radio could run.

There's a wiring diagram in the archives as I recall that is for a 520 and some beefing up may make it suitable for operation of an 830 since I believe it may draw a little more than a 520. The 830 is rated at 295 watts while transmitting.

So there's some options I've seen so far. I had a 300/400 watt inverter in my freightliner once, but it didn't have enough gump to run the 830. I used to plug in along the parking lot along with my phone to make calls. The larger inverter would have meant I had to direct wire to the batteries. In my company that waas a definite no no. I've seen what happened when some one did that to his truck at the Atlanta terminal.

Michael Bellis <theloneprospector@...> wrote:
This is only my second post, although I have been watching diligently
for about six weeks --- want to thank John Harp for his kind responce to my inquiry about transverters a couple of weeks ago and praise his refusal to get involved in the recent ruckus. Now to my question. I have an 830s that was bought in Singapore in 1981, it's had the mod to it's main transformer circuitry allowing it to operate on 120v. But I do see some reference to it's main transformer having DC windings unlike US models, thus perhaps allowing it to accept the dc to dc DS-2 power supply. Any knowledge about this would be appreciated and if it's true, anyone with a DS-2 for sale would be and instant friend! won't be able to respond until 12-30-06.

Ellen, the TS-830 allows an external antenna jack thru the dins on the back of the radio. I forget what pins and could go look it up. I would think the remote jack for 830. I'd imagine the 820 would have the same or similar setup. Just the jacks are a little different. You might look into it.

Ellen R <ellenjoanne2003@...> wrote: Bummer! A separate Receive Antenna jack would be very useful for
bands like 160m, where separate receive antennas are very useful. It
would elminate the hassle of having to use a relay/sequncer to switch
antennas. I'm surpised that the TS-520SE has it and my TS-820
doesn't. But then again, my 820 is an earlier radio, and maybe they
didnt' offer it until the 520S & 820S lines came out.

Phil, are you using a straight key when you plug in or are you plugging in a keyer?

phil pavey <PPAVEY@...> wrote: Greetings all,

My TS830s has developed an interesting problem. Whenever I put the rig into CW and insert a key (or even an unterminated plug) I get constant cw sidetone - at about 25% of the volume of when I use the CW key on recieve. If I put the rig into transmit it does not cause any output power (but the sidetone goes up to the full volume). If I switch in the "Vox" it does trip the rig into transmit.

I have ensured with a multimeter that I have no problem with the plugs, leads or the key...

any idea's?

As I use the rig 99% for CW I would like to fix this asap!

From: Another Old Codger
Topic: 11838 Message: 11858

From experience of small inverters they don't like surges, i.e. going to transmit, The difference is from about 30 watts to about 300 watts. Which indicate that you would need about 500 watts. Of course with the heaters, which take about 5 amps, you standing load would be around 80 to 100 watts. This would have a flywheel effect and stabilise the inverter load. That would be the advantage of not modifying the rig in any way. The inverter load would be around 30 amps, it depends on the efficiency of the inverter, they tend to be more efficient as the load increases.

So the answer is, you will need to have the engine running, have a good and beefy battery, and if possible an alternator with a good low speed output. A nice tight fan belt will be a help!

Or, you can do it the nautical way, fit an additional alternator, a nice big additional leisure/RV style battery and make it independent of the vehicle electrics. The leisure battery can accept deep discharge, and is different construction because it does not need to have a heavy starter current. You can get very big leisure batteries. We have a 90 Ampere Hour in our Trailer/Caravan, the next size up is 120 AH.

I don't know to much about Solar Power, we have a small panel that trickle charges the trailer battery, as far as I can see you can have almost unlimited power, providing you pay for it. <Grin>

Of course my figures are approximate, it depends somewhat on the individual rig.

Good luck, Ron G8URU

I looked at both the instruction manual and the service manual. I see a way to feed a recieved signal thru the transverter jack via pin #8. You could access t/r switching or power via the jacks to if need be.

Graham Ridgeway <m5aav@...> wrote: On Tue, 26 Dec 2006 08:09:24 -0500, "n9wb" <n9wb@...> wrote:

I disagree.....looking at the Service Manual it allows the use of
a separate antenna on receive.

In the normal position it uses the same antenna [the SO239] on Rx and
Tx, switched across to 'ext' it uses the other socket on the Rx path
[and also avoids two sets of relay contacts] - could be very handy if
you have space for, say, a Beverage on 160 for Rx as well as a
suitable vertical for Tx.

An addition to the early answer, it's simple efficiency. Say the inverter is 80% efficient, and the mains txformer is 90% efficient, that adds up to an extra load on the battery. Wired directly the filaments are 100% efficient, but see my earlier comment re: stabilising the inverter. Alternator whine should be no worse than your car radio, though the 'nutters' in GB fit super large capacitors across the supply, 1, (ONE) Farad!!!! They are the size of a large can of beans.

I thank you for this info Ron. This is handy Aand something I was gonna ask around.

Just for the sake of knowing, why would the filaments be wired separately? Efficiency and all that. Is there an alternator noise problem? I like what you brought to light here. I just needed to know the details if you wouldn't mind.

Another Old Codger <clattering.ford@...> wrote:
On the 520 and 820, when the inverter board is fitted, the multi-way
power plug is wired to feed the heaters of the driver and PA from the battery, via the HTR switch. If you were running and 830 or a 530 from an inverter it would be advisable to wire the heaters direct to the battery, via the HTR switch. Trying to power the whole rig from an inverter would be an unnecessary load, and would also be inefficient due to the losses in the inverter.

As the 830/530 has a similar mains transformer as the 820/520, with a split primary, it should be possible to use the same inverter circuit, thus avoiding many of the losses of a separate inverter. Of course your 830/530 would never be quite the same. A good idea as long as you are happy with a dedicated vehicle rig.

Many of the 'narrow boats' used on British canals use a separate 240 volt 50 HZ alternator driven from the engine. Or a separate alternator charging a massive storage battery, or batteries, and a very big inverter, several Kilowatts.

Subject: Re: [TS-520_820_530_830] TS-830s on 12v with DS-2

Ok well thank you Michael. Currently I'm working toward a solar station that will someday drive my 830. I've considered using the 12 volt version of 6146's and maybe it's modification of the High Voltage to it's tubes. Now for some radios that the transformers were lost this may get them going again. Gordon has recently pondered the idea of a project using those tubes.

I've heard of other in the past taking the radio out in thier RV's and using an inverter from batteries. I've seen it done in tractor trailers too. So my question is what size inverter to drive about 300 watts and how quiet will it be?

Now I've heard of this DS-2 but not a thing more. This may be a hard to find item. There was an accessory available as I recall for the TS-520 to convert 12 volts to something the radio could run.

There's a wiring diagram in the archives as I recall that is for a 520 and some beefing up may make it suitable for operation of an 830 since I believe it may draw a little more than a 520. The 830 is rated at 295 watts while transmitting.

So there's some options I've seen so far. I had a 300/400 watt inverter in my freightliner once, but it didn't have enough gump to run the 830. I used to plug in along the parking lot along with my phone to make calls. The larger inverter would have meant I had to direct wire to the batteries. In my company that waas a definite no no. I've seen what happened when some one did that to his truck at the Atlanta terminal.

Michael Bellis <theloneprospector@...> wrote:
This is only my second post, although I have been watching
diligently
for about six weeks --- want to thank John Harp for his kind responce to my inquiry about transverters a couple of weeks ago and praise his refusal to get involved in the recent ruckus. Now to my question. I have an 830s that was bought in Singapore in 1981, it's had the mod to it's main transformer circuitry allowing it to operate on 120v. But I do see some reference to it's main transformer having DC windings unlike US models, thus perhaps allowing it to accept the dc to dc DS-2 power supply. Any knowledge about this would be appreciated and if it's true, anyone with a DS-2 for sale would be and instant friend! won't be able to respond until 12-30-06.

11862. Re: [TS-520_820_530_830] TS-520 SE Mode Switch and S Meter

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-31 00:16:03 UTC
From: John Harp
Topic: 11770 Message: 11862

Well you could spray a freeze it on the parts and see what thaws out first. Sometimes that part is drawing excessive current. I'm wondering about the meter circuit tho.

baumbrent <brentbaum5323@...> wrote: I discovered two new problems with my 520SE over the holiday break.

1. The S meter will only run up to S 2.5, even on a signal that is rattling the windows. I suppose it needs to be adjusted. Is there a way to do so without using a signal generator? (It's a 50 mile one way trip to the big city to find someone who has one.) I need to get the S meter working so I can bring the 10 meter section into oscillation and peak the rest of the bands.

2. The audio output drops to about half volume after warm up, or if the radio gets bumped. Sometimes I can cycle the Mode switch and bring it back for a while, but it soon drops out again. Something is probably loose and/or reacting thermally. Any ideas before I begin chasing electrons through the schematics?

By the way I had a quick QSO from Northern Utah with N5PYJ in Texas at about 1600 MST yesterday. He was running an 830S at about 85 watts. Arm chair copy through the QRN.

Thanks all, and happy new year.
K7MEI, Brent

From: Gordon
Topic: 11863 Message: 11863

I have a Great working VFO-230 for sale. It has some scratches on the case where it rubbed against other gear, but it Works 100 %.
It comes with the Original Cable but No manual. I can provide a Copy of the manual if needed.
I am asking $ 300.00 plus shipping Shipping should be about $20.00 anywhere in the US insured via UPS!

Please contact me OFF list n6wk at n6wk.com

73,
Gordon

Ya know that's true. Board swapping, into the rotation and someone else looks at it. Then throws it away. Not much to work on these days in the newer stuff. Why do they need a tech for this? No wonder there's no tech jobs no more.

Another Old Codger <clattering.ford@...> wrote: Hello Alan,

When I received my TS-530 it needed alignment, I followed the
alignment procedure in the operating manual, using the Cal signal, it
made a vast improvement. When I received the Technical Manual the same
procedure required a large amount of test equipment, which I thought
was rather humorous.

Read the Operating Manual till you are word perfect, buy the few
simple tools needed and do it your self. That's why you are an
Amateur.

The TS series are not 'black boxes' that need the professionals!! and
any way most of them are board changers, I know, I used to be one
myself in my professional life.

Hi
Hope you are are all having a good holiday season,and may i wish you
all a good new year.
Just got hold of a TS520se and hope to have it up and running soon.I
think it just needs re-aligned,tried contacting a few radio shops here
in the UK, but not had any luck yet yet in getting one to do the work.
(they say it`s too old).

bye just now and best wishes to you all from Scotland.

Alan MM3 HVB

11866. Re: [TS-520_820_530_830] 830s on 12v with the DS-2

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-31 00:44:03 UTC
From: John Harp
Topic: 11838 Message: 11866

No hey your input has been greatly appreciated. I've got two solar panels that are rated at 15 watts and will add more soon. I can run up to 7 panels on my regulator for a total of 105 watts. I just have two to start out.

Now I have bought three brand new batteries, small but it's just for starting out the new system with. They had each 275 cranking amps. They are like the size of a lawn mower battery, not big enough for a car. They run other things on my station right now. I just got started at this solar thing. The regulator basically just keeps the battery bank maintained. There's hardly a load on it right now.

THe inverter information is what I was out to find next. I had a 300/400 watt inverter before in my freightliner and found it didn't have enough gump for the 830 to work. I was tight for cash so I just plugged in at truck stops with an extension cord to use the 830 when I dropped a line on the log.

Now I am no longer driving and my station is at a fixed location. I'm growing into solar power and was looking for the information you just gave me. Thank You and I'll be using that to determine what to buy for the solar equipment.

Yes you're right I pay for it initially, but that's availability down the road, not to mention the price of learning for going mobile or portable. Others have used them in RV's in the past and that was the information I was looking to get from them.

Thanks again Ron.

John KA3DPW Parkesburg Pennsylvania in the states.

Another Old Codger <clattering.ford@...> wrote:
From experience of small inverters they don't like surges, i.e. going to transmit, The difference is from about 30 watts to about 300 watts. Which indicate that you would need about 500 watts. Of course with the heaters, which take about 5 amps, you standing load would be around 80 to 100 watts. This would have a flywheel effect and stabilise the inverter load. That would be the advantage of not modifying the rig in any way. The inverter load would be around 30 amps, it depends on the efficiency of the inverter, they tend to be more efficient as the load increases.

So the answer is, you will need to have the engine running, have a good and beefy battery, and if possible an alternator with a good low speed output. A nice tight fan belt will be a help!

Or, you can do it the nautical way, fit an additional alternator, a nice big additional leisure/RV style battery and make it independent of the vehicle electrics. The leisure battery can accept deep discharge, and is different construction because it does not need to have a heavy starter current. You can get very big leisure batteries.

We have a 90 Ampere Hour in our Trailer/Caravan, the next size up is 120 AH.

I don't know to much about Solar Power, we have a small panel that trickle charges the trailer battery, as far as I can see you can have almost unlimited power, providing you pay for it. <Grin>

Of course my figures are approximate, it depends somewhat on the individual rig.

Good luck, Ron G8URU

I have lately noticed that I have a hard time getting any ALC reading on 40. I can tune up OK and am heard just fine. Band switch? Also noticed recently that RIT and XIT are non functional. No change with switch on or off. Don't generally use them, but would like to have them working. This is a beautiful radio with great ears and great signal reports. I have had it for about 6 months now and love it. I think the 520 may be jealous.

Doug, keep an eye on your finals since you had that connector open. High SWR's like that will take a toll on them. Granted the finals in these tube rigs are tough but that is stress that is hard on any output of any radio.

Be glad it happened with the FT897 tho. Imagine the havoc wreaked on your favorate solid state rig. Tubes can go 5:1 tops but 1.8 will shut down solid state gear many times. These tube rigs you can fix more easily. The other stuff may be more difficult.

Good luck with all of it. See you on the air.

Is the ALC a problem just on 40 or is it elsewhere also? Have you tried swapping to a known to be good 12BY7A driver tube?

George Copeland <gdrums@...> wrote: I have lately noticed that I have a hard time getting any ALC reading
on 40. I can tune up OK and am heard just fine. Band switch? Also
noticed recently that RIT and XIT are non functional. No change with
switch on or off. Don't generally use them, but would like to have
them working. This is a beautiful radio with great ears and great
signal reports. I have had it for about 6 months now and love it. I
think the 520 may be jealous.

Not without considerable studying right now for the operation. But a suggestion, go to ebay and put in to your ebay favorates a search for AT-230 . As one comes around you'll be notified via e-mail.

I hope you have something to use for the meantime. They are around but it takes time to find them.

I stuck to a cheap MFJ tuner for over 20 years, then got a versa tuner V since I had decided I'd go to an amplifier and my antenna then was a G5RV. I found it more easily accepted all types of loads. But I still would like to have the vintage like you. Maybe someday. But do what I described above and bid right and you could have what you want with careful bidding and observation.

You may try the auction houses that sell nothing but ham gear and check swap listings. There was some gear for sale recently posted by Max selling his radio and accessories, you might check out what he has, but I think he was planning to sell it all at once. Check and see what he has to say.

Hi John,

I checked both the Users Manual, and the Service Manual. The TS-820
9and probably the 820S) does not have the separate receive antenna
feature the TS-830S has. OH well.

73,
Ellen - AF9J

11877. TS-520 blew fuse, transformer smell - seeking advice

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-31 05:11:21 UTC
From: cvflec
Topic: 11877 Message: 11877

I had my 520 hooked to a 80/40 dipole when a couple of weeks ago a storm came through with some electricity in it. I had the rig off but it was connected to the antenna. I was hearing a popping sound in the radio room and came to investigate. I noticed the gear was receiving periodic spark charges so the antenna was removed.

Later that day, I went to power up the radio. I turned the transceiver on but not the heater switch. I had receive and lites for about 5 seconds, then things went dead and a smell developed. The 6 amp fuse blew.

I fortunately found this site and surfed the various questions and answers. I am grateful for the advice on constructing the transformer saver. After removing the DC-DC converter, I powered up the radio. I had receive and the heater seemed to want to operate. Than after a couple of minutes, the 100W light bulb went bright. I have now disconnected everything from the secondary of the transformer. I have also removed the 12.6 volt connection on the side where the transformer inputs are. I still have a bright 100 watt light.

Can someone advise if the worst has happened? Is my transformer smoked?

Thanks, Curtis N7GZ

11881. Re: I think I broke it!!!!

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-31 15:58:33 UTC
From: mi_magic3
Topic: 11532 Message: 11881

Well I went back thru the tuning procedure and I do get "some" power out. By some I mean about 55 watts on CW (measured with a Bird 43 Watt meter). I'm thinking that the tubes are a bit soft? But the real bad news is that on SSB I get NOTHING. I have tried two different mics that I know are properly wired for this radio. One being the MC-50, and yes the switch is on on the mic! LOL. When I put the radio on VOX and speak, the radio seems to go into transmit mode as I hear relay clicks, but no indication of power output. So I guess that means that the mic circuitry is somewhat working if the radio goes into transmit on VOX, but with no output power, I am guessing something is broke between the mic circuit and the modulation circuits? Not sure if I am saying that right. If anyone can provide a starting point for trouble shooting this problem I would appreciate it. I do have the service manual, a digital voltmeter and an oscilliscope, a freq counter and signal generator, but sure have little trouble shooting experience with radio stuff. My backround is on old computer junk! I used to be a bench technician before my hair went gray and gut started going over the belt... Thanks all in andvance, this is a wonerful group..

Happy New year!!

vy 73 Dave N8HUL

11882. TS820S busted

From: Jack
Topic: 11882 Message: 11882

Hi Group.

Hope you all have a very prosperous and healthy new year.
I hope you can help me or at least point me in the right direction.
My 820 has been dropping out and coming back on for the past couple of
weeks and I haven't had time to get at it. jJWell, it finally
dropped out and will not return to life. It has a half life in that
the meter lamps work, the dial lamp works and the leds work. I get
no receive and no transmit. I don't see any scorched components nor
smell anything burnt. I think it's in the power supply so I guess
that's where I should start. I suspect some diodes have gone bad or
a filter cap may have opened up.

ANy suggestions on where to start and where I can get replacement caps
both the 150/500V and the 22/22@450V kind.

thanks in advance and Happy New Year.

Jack

11883. Re: [TS-520_820_530_830] AT-230

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-12-31 16:40:33 UTC
From: John Harp
Topic: 6938 Message: 11883

Ok well that's how I go about mine. I just let the money sit in an ING direct account and when I'm ready I just pul it down.

Then while I'm waiting I watch all the items I am watching and bidding low but carefully. Usually something like that will be a silent key estate. That's when someone really doesn't know much about the item. Thus it is "as is". To fix something like a AT-230 probably wouldn't be to hard, if it broke.

I forgot to tell you check on eham.net and other listings. There are auction places that do just ham radio gear, usually from silent key estates. That way gear gets a second chance before it hits a land fill and one of us wished we had it.

Finally post awant ads. This is one place and ebay another and eham also among others.

They usually appear towards the holidays on ebay, probably that's a good time to sell it to someone who will buy for a ham for a gift. Otherwise they show up at hamfests and swaps.

Something like this would be a years projection. I usually buy in the fall thru the holidays and get it running over the winter. I have two transverters and a clock that are projects for this winter. I can work on them while the 830 is on in the station.

My solar project cut into funds and kept things tight to spend on more expensive items but some unexpected buys showed up this year as well. So it's been good all the way around.

The vintage dream station comes together slowly but is doing a pace I can deal with. It's like building a nice place to live that say this is me. You don't build it all at once. You put it together a little here and some more then and more yet later. For if you did it all at once what would you do with the rest of the time. Some call it putz around. I think of it as a little of you with stories to go with it.

Sometimes I ask if someone could tell me a little about the item. It goes with its story.

Someday hopefully my AT-230 will be the same way.

WEll the save the transformer prject tells you if the transformer is still good by the way the light shines, bright or dim. That way you know if the transformer is still good. They are worth checking since they are alot of times not cheap and may take you a while to find.

Now the power supply I would check next. That and do a good cleaning and maintenance if the radio to help eliminate other problems. It may help you to spot things you weren't already aware of.

Try not to turn the radio on anymore than you must at this point as it can make a dfference in something else failing or surviving.

Wait for someone to talk you thru something to fix it. Some things are common problems in these radios. Your at an evaluation point right now. First you already know what the status of the transformer is by the sound of things.

Back to you. John-KA3DPW.

An in rush protector is good in that it when you turn on the item plugged into it it slows down the initial rushof power temporarily. This reduces the stress on components inside the unit.

I have a 120 unit and a 220 unit. Right now my 220 unit is in use on my linear amplifier. It draws 220, I rewired it from 120. It keeps the stress off of parts inside and it keeps the surge current from being larger on a line. For example if I turn my amp on it pulls a big surge and then drops to about 9 amps. That's why I went to a large conductor wire and chanced up to 220. It runs better.

The surge protector is how I turn the amp on to. Thus I can hopefully get a longer life from my amplifier. They're not expensive and for me it saves headaches down the road hopefully.

I kept my 120 and may put it on the 830 too. Why not I already paid for it since I converted my one amp to 220 the other is not working right now. It may help the amp plus it makes a good place to turn on the unit right next to the amps unit, Keep them in one place.

They have a surge button you can reset and an illuminated switch on mine They keep the initial surge on the line down omoentarily by the way they are built switching back just after the surge. So to me they have some plusses.

OK Dave,
1) have the tubes been replaced with known good final tubes? This may make it an easy change for you and don't for get the neutralization if you do it.

2) what is your high voltage? Have you looked around the finals. Check the resistors visibly.
and ohm them out. The value looks off there may be a problem.

3) how's the ALC? and the condition of your drive tube 12BY7A?

You may be right there may be something wrong between the mic input and the modulation stages, but try to eliminate the obvious first. This is info someone like Walt or Gordon may need to help you track the problem.

mi_magic3 <mi_magic3@...> wrote:
Well I went back thru the tuning procedure and I do get "some" power out. By some I mean about 55 watts on CW (measured with a Bird 43 Watt meter). I'm thinking that the tubes are a bit soft? But the real bad news is that on SSB I get NOTHING. I have tried two different mics that I know are properly wired for this radio. One being the MC-50, and yes the switch is on on the mic! LOL. When I put the radio on VOX and speak, the radio seems to go into transmit mode as I hear relay clicks, but no indication of power output. So I guess that means that the mic circuitry is somewhat working if the radio goes into transmit on VOX, but with no output power, I am guessing something is broke between the mic circuit and the modulation circuits? Not sure if I am saying that right. If anyone can provide a starting point for trouble shooting this problem I would appreciate it. I do have the service manual, a digital voltmeter and an oscilliscope, a freq counter and signal generator, but sure have little trouble shooting experience with radio stuff. My backround is on old computer junk! I used to be a bench technician before my hair went gray and gut started going over the belt... Thanks all in andvance, this is a wonerful group..

Happy New year!!

You could put the unit on the save the transformer circuit and keep the transformer on lie a ballast while you check what's going on inside. Check the trasformer outputs and them easure the power supply outs. This will help you to pinpoint the culprit component. how's the high voltage? Hows the ALC?

Here is info on the caps.
One person recently said check with Ken K4EAA for the needed caps.

Here's what Cliff responded with in an email not long ago.

"Another source for the caps is Digikey. The 150/500 are $5.96 in
onesies, or with a few friends $5.05 in 10's or a lot of friends $3.63
in 50's. Buy 200 and they're down to $2.73. The PN is P7452-ND.

Or if you want the 100uf/500 they start at $4.66 and go down... P7449-ND

Clif"

By the way, don't keep turning them on and running like that. It sometimes makes your problems worse, like if it takes the transformer out. You don't want that headache.

Odds are your right, something in the power supply. It probably wouldn't hurt to change out those caps. They are something that goes in these units I'm told. After all they are about 30 years old.

One thing I forgot to say is that there are inverters and there are inverters, some cheap and cheerful, some excellent. Some give little better than a square wave output, which most electronic equipment won't like, and then there are the 'modified sine wave' type which give a near sine wave output. But the quality of that sine wave depends on the inverter manufacturers opinion. So I would suggest that you see your rig running on full load before you buy. Generally speaking, the quality of the inverter output can be judged by listening to your rigs mains transformer, squarer the output, the more noise from the tranny. Frequency stability is a good quality but as the rig is designed to operate from around 48 HZ to 63HZ it shouldn't worry it to much

No hey your input has been greatly appreciated. I've got two solar panels that are rated at 15 watts and will add more soon. I can run up to 7 panels on my regulator for a total of 105 watts. I just have two to start out.

Now I have bought three brand new batteries, small but it's just for starting out the new system with. They had each 275 cranking amps. They are like the size of a lawn mower battery, not big enough for a car. They run other things on my station right now. I just got started at this solar thing. The regulator basically just keeps the battery bank maintained. There's hardly a load on it right now.

THe inverter information is what I was out to find next. I had a 300/400 watt inverter before in my freightliner and found it didn't have enough gump for the 830 to work. I was tight for cash so I just plugged in at truck stops with an extension cord to use the 830 when I dropped a line on the log.

Now I am no longer driving and my station is at a fixed location. I'm growing into solar power and was looking for the information you just gave me. Thank You and I'll be using that to determine what to buy for the solar equipment.

Yes you're right I pay for it initially, but that's availability down the road, not to mention the price of learning for going mobile or portable. Others have used them in RV's in the past and that was

the information I was looking to get from them.

Thanks again Ron.

Well this is my last post on the subject, I have done quite abit of research and can now conclusively say that the 830s radios that were sold overseas did infact have a differant power transformer from US models, including a terminal board inside the rear removable plate to mount and directly solder the DS-2 wires. The DS-2 is not an inverter nor is there one inside the 830. An photo example of the rear of an 830 (M) is posted right here on our own sites photo collection by SU1BDO and clearly shows the power plug labeled 220v/240v/13.8vdc, although it is not fitted with the DS-2. All of this is a rather moot point for most of you, unless like myself you own a (M) version and besides I'm not so sure a DS-2 is easily found anyway. I have seen several radios for sale in Germany and England that have the DS-2 installed and refer to being used on 12v.
The manual states that a strong inrush and continous 15 amps at 13.8vdc is neccessary to power the unit.

Hi Group.

Hope you all have a very prosperous and healthy new year.
I hope you can help me or at least point me in the right direction.
My 820 has been dropping out and coming back on for the past couple of weeks and I haven't had time to get at it. jJWell, it finally dropped out and will not return to life. It has a half life in that the meter lamps work, the dial lamp works and the leds work. I get no receive and no transmit. I don't see any scorched components nor smell anything burnt. I think it's in the power supply so I guess that's where I should start. I suspect some diodes have gone bad or a filter cap may have opened up.

ANy suggestions on where to start and where I can get replacement caps both the 150/500V and the 22/22@450V kind.

thanks in advance and Happy New Year.

Jack

Jack,
Start by checking EVERY component on the Rectifier Board and the HV board.
I would also recommend cleaning EVERY connector on every board with De-Oxit.
Might want to clean the Band switch with De-Oxit also.

Curtis:

I would not rush to the conclusion that the transformer is bad yet. Remove all wires from the transformer noting where they go. On top of the rig next to the final section is a terminal board for the DC inverter. I think that you said that you removed any wires going to this terminal except those leading to the transformer. Be sure that this is correct.

By all wires to the transformer, I also mean the wires to the primary. There are two primary windings. They each have taps labeled 0, 100, and 120. Be sure all wires on both of these windings are removed. Label them as to where they go. They must go back to the same winding that they were originally on so label them something like 0 A, 110, A 120 A and 0 B 100 B, 120 B so that you do not get them back on the opposite winding. This is very important. Tape the ends so they do not get into mischief. Now, reconnect the rig to the light bulb tester and note the results. If the light bulb goes bright with the transformer disconnected, the transformer is likely not bad. If it does not, this is not a good sign, but I will have you do some other things before condemning the transformer.

I may not be able to get right back with you for a couple of days. But do the above and write us. I will get back with you with further steps In a couple of days.

Another question, was the first fuse that blew a 6 amp. Was there ever a larger fuse that blew ? Does the transformer seem to smell with the rig disconnected ?

Subject: [TS-520_820_530_830] TS-520 blew fuse, transformer smell - seeking advice

I had my 520 hooked to a 80/40 dipole when a couple of weeks ago a
storm came through with some electricity in it. I had the rig off
but it was connected to the antenna. I was hearing a popping sound
in the radio room and came to investigate. I noticed the gear was
receiving periodic spark charges so the antenna was removed.

Later that day, I went to power up the radio. I turned the
transceiver on but not the heater switch. I had receive and lites
for about 5 seconds, then things went dead and a smell developed.
The 6 amp fuse blew.

I fortunately found this site and surfed the various questions and
answers. I am grateful for the advice on constructing the
transformer saver. After removing the DC-DC converter, I powered up
the radio. I had receive and the heater seemed to want to operate.

Than after a couple of minutes, the 100W light bulb went bright. I have now disconnected everything from the secondary of the transformer. I have also removed the 12.6 volt connection on the side where the transformer inputs are. I still have a bright 100 watt light.

Can someone advise if the worst has happened? Is my transformer smoked?

Thanks, Curtis N7GZ

Well unfortunately that's about what I've seen them go for on ebay in the past at times too. That's why I stick to my versa tuner V. I originally bought it for that new and can tune more odd combinations than the AT-230. I get some odd settings on different antennas and to me it's worth keeping the tuner around. I like it for my linear too.

The AT-230 is ok for tuning center fed doublets at or near resonance, but I use end fed and have tuned some things in the past that really shouldn't load.

I can take my 40 meter vertical for example Ron, and tune it up on 160 to 3:1.

My G5RV's have had some tuning at times that would be difficult for other tuners. I've used ladderline in the past and that is needing a higher impedance like that from a good balun.

So to me I'd like to compliment the station someday, but I wouldn't part from my other tuner because it can get some other match ups you can't obtain with the other tuner.

The instruction manual shows this plate you speak of in the rear view diagram. Yet this plate is not on the back of the 830S. Now I do know that there were different transformers in the 820 from the 830 and a transformer from a 530 should work an 830. But I don't know about the extra winding and I hear the dimensions are different for a transformer of the 520 and 820 line.

But thanks to everybody for the info. But a DS-2 isn't something I would persue. Another avenue is needed for my DC conversion.

Michael Bellis <theloneprospector@...> wrote:

I've just checked the TS-830 Technical Manual and there are two distinct models, Model W, and all the rest. Model W has extra windings on the power transformer, to allow the fitting of the DS2 which is an oscillator board, the same as an inverter but without the transformer. The multi-way plug/socket allows the wiring to be rearranged to allow operation on 13.9V. For all practical arguments this is a DC to DC inverter.

To convert a non Model W would be a difficult job, even if you could get the parts.

Interestingly, the DS-2 is not an option available on the TS-530.

So those who want to operate with 13.8V need to find a TS-830 Model W, preferably with the DS=2 fitted, though the circuit is so simple a reasonable Ham could build one.

Well this is my last post on the subject, I have done quite abit of research and can now conclusively say that the 830s radios that were sold overseas did infact have a differant power transformer from US models, including a terminal board inside the rear removable plate to mount and directly solder the DS-2 wires. The DS-2 is not an inverter nor is there one inside the 830. An photo example of the rear of an 830 (M) is posted right here on our own sites photo collection by SU1BDO and clearly shows the power plug labeled 220v/240v/13.8vdc, although it is not fitted with the DS-2. All of this is a rather moot point for most of you, unless like myself you own a (M) version and besides I'm not so sure a DS-2 is easily found anyway. I have seen several radios for sale in Germany and England that have the DS-2 installed and refer to being used on 12v.
The manual states that a strong inrush and continous 15 amps at 13.8vdc is neccessary to power the unit.
